JAVASCRIPT-BASED BILLBOOK INTERFACE WITH SAVE OPTION

■ **BUKYA SRIDHAR**

Electronic billing has become part and parcel of most of the shopping establishments, industries, enterprises, etc. A bill is a proof of purchase of an item or availing a service. Therefore a bill is mandatory whenever any monetary transaction takes place. Businesses need to maintain a ledger or a bill book where one

needs to enter all the transactions of purchase and also the total money accrued through the transaction.

Presented here is an interface coded in JavaScript that keeps track of all the billing needs, like printing the bill and saving the bill for future references. Once the program is launched, it opens up an interface that has a table with various input cells for entering the data. It has an automatic number-

ing system for the receipt number, date and time print, and gives the total amount in words. It also has a program-alterable value-added tax (VAT) calculator.

There is also an option wherein the current receipt can be secured by just clicking a button. The program then appends the current form to the new form, so the records so saved are in the order they were entered.

Software program

The program, when run, opens up an Excel type table with user-input cells/editable rows and columns, viz. s.no./code, description, quantity, price and total.
