

Audio & Video Tools

For recording, editing and converting audio and video files into several different formats

Audacity

Audacity is a free, open source software for recording and editing sounds. It supports uncompressed audio standards such as WAV and AIFF in addition to OGG and MP3 files. Using this you can record, play, edit and even do multitrack mixing of supported audio files. It is available for Mac OS X, Microsoft Windows, GNU/Linux and other operating systems.

MPEGRecorder

MPEGRecorder is a real-time recorder and compressor of audio and video input for the Windows platform, using MFC, DirectX, FFMPEG and MPEG4IP. The program is capable of generating avi and mp4 files and streaming MPEG-4 audio and video via Apple Darwin streaming server. It also supports scheduling of an automatic AV recording.

HandBrake

HandBrake is a GPL-licensed, multiplatform, multi-threaded video transcoder. It converts video, and does not rip it byte by byte. Also it does not crack the latest DVD

copy-protection schemes hatched by the studios. It can convert video from nearly any format to a handful of modern ones. It supports batch encoding through the Windows, Linux and OS X GUI, though jobs must be queued one by one.

Streamripper

Streamripper records shoutcast-compatible streams. For shoutcast-style streams, it finds the meta data or track separation data, and uses that as a marker for where the track should be separated. It is a standalone client that records Internet radio streams in the MP3 or Vorbis format. Streamripper works on many platforms including Windows and GNU/Linux.

CDex

CDex is a CD-Ripper that extracts digital audio data from an Audio CD. It can convert CD audio into several formats including WAV, Vorbis, MP3 (using the LAME encoder), VQF, Musepack and APE. In addition, WAV files on the hard drive can be converted into a compressed audio file (and vice versa). It works on nearly all versions of MS Windows.
