

TO TOUCH OR NOT TO TOUCH.

IT'S NOT A QUESTION,
IT'S OUR SOLUTION.

Whether your application is gesture or touch-based, the QuickSense™ portfolio of highly accurate and fast-response touch, proximity and ambient light sense devices offers a more sensitive, better performing and lower power alternative to existing sensing solutions.

Silicon Labs makes it easy to program these sensing devices with the QuickSense Studio development software:

- Set up capacitive buttons, sliders and wheels using an intuitive software GUI that generates all the C code required for the selected functions
- Configure proximity and ambient light sensors through a comprehensive library of application programming interfaces (APIs)
- Thoroughly test and optimize user interfaces with real-time monitoring and adjustment tools

SI1120 AMBIENT LIGHT AND PROXIMITY SENSORS

- Up to 50 cm proximity range with a single pulse
- Configurable ambient light and proximity measurement modes for range optimization
- High EMI immunity without shielded packaging
- Works in direct sunlight (100 klux)
- Minimum reflectance sensitivity <1 μW/cm²
- Operating temperature range: -40 to +85 °C
- Low power typical 100 μA current consumption
- Programmable 400/50 mA LED constant current driver output

CR805F7xx/8xx CAPACITIVE TOUCH SENSE MCU

- Supports capacitive buttons, sliders, wheels and capacitive proximity sensing with 16 or 38 channels
- High-speed 25 MIPS CPU allows plenty of power for application code
- 10-bit, 500 kps single-ended ADC
- Integrated temperature sensor
- Precision calibrated 24.5 MHz internal oscillator

TOUCH-LESS INTERFACE

- Enables users to interact with electronics with a simple gesture
- Enables entirely new form factors and usage models for common electronics
