

Canon India is a wholly-owned subsidiary of Canon Singapore—a world leader in imaging technologies. Set up in 1997, Canon India markets over 140 comprehensive range of sophisticated contemporary digital imaging.

Shunichi Senda heads the imaging communication products (ICP) sales and marketing activities of Canon in India. He has been instrumental in building the Canon brand and growing the company's IT peripherals group across countries.

Senda has over 22 years of experience in product planning, sales and marketing. At Canon, he has brought consistency in IT business.

Recently, Senda spoke to Uma Bansal, deputy editor at EFY, about the latest trends in digital cameras. Excerpts:

■ SHUNICHI SENDA
DIRECTOR, IMAGING COMMUNICATION PRODUCTS, CANON, INDIA

“Megapixel is not the most important thing in cameras”

What are the trends in point-and-shoot digital cameras?

Point-and-shoot cameras are the largest segment of the digital camera market. These are compact, easy to use, and typically take great pictures with minimal effort. With a point-and-shoot camera, you simply press the shutter button and the camera automatically adjusts the shutter speed, aperture, focus and light sensitivity to capture a clear image with optimal colour. Unlike digital SLRs, which offer more manual control and interchangeable lenses, point-and-shoot cameras can slip into your pocket and are much less expensive than their D-SLR counterparts.

Image stabilisation, which helps reduce the blur that can come from shaky hands, is an important feature to have. If a camera has digital image stabilisation, that's fine, but it should have optical or sensor-shift stabilisation too. Virtually all of today's cameras include face-detection technology, which finds and focuses on faces in the frame and improves the overall composition and quality of the image by optimising the colour and white balance. Optical zoom specifications are also important, especially while clicking

landscape photos.

How soon will we see cameras that capture 3-D video and photos?

The 3-D technology has reached home televisions and now the new 3-D digital cameras are getting a lot of attention for a similar feature.

3-D images can be created from any camera and the most common way to capture them is to use two linked cameras. It can also be done through a special lens that captures two images with a single shutter release.

How much will they cost?

The cost would depend on the technology being used and hence the price range of these products would vary.

More and more cameras are coming with HD video recording capability? What are the advantages of a full HD camera over the normal one?

The principle difference between a normal camera and a full HD camera is the number of pixels (points of light) that
