

with integrated serial digital interface (SDI). 4K resolution is rapidly becoming the next major enhancement in video because of the benefits in picture clarity and realism. Many leading projector, broadcast and camera OEMs are either shipping such systems today or will by the end of this year.

Altera's 4K reference design is claimed to enable the fastest design cycle for video applications. It includes the video and image processing suite with MegaCore functions that facilitate the development of custom video and image processing designs. Also included is the hardware demonstration on a Stratix IV GX A/V kit for affordable 4K video capture, editing, playback, format conversion and projection solutions, Nios II embedded processor, a multiport front-end DDR3 memory controller and integrated SDI. This combined functionality of the broadcast-quality 4K reference design accelerates customers' time to market by combining an optimised video design tool flow to support 4K resolution and 3-D processing.

First 2.4GHz system-on-chip

Texas Instruments claims to have introduced the industry's first fully optimised IEEE 802.15.4 system-on-chip for remote control applications. The CC2533 is said to enable single-chip remote controls to be built with lower power, higher reliability and lower bill-of-materials cost than alternative devices, providing an out-of-the-box solution for home entertainment devices (TVs, set-top boxes, Blu-ray players and home theatres).

The CC2533 is designed specifically for the ZigBee RF4CE chip market. ZigBee RF4CE is a standardised specification for radio-frequency communications that enables faster, more reliable and greater flexibility for devices to operate from larger distances. It removes the line-of-sight and field-of-vision barriers in today's infrared remotes. With its two-way communication, ZigBee RF4CE opens the door to a whole new set of capabilities and consumer experiences.

16GB NAND BGA package

Microsemi now offers a high-density single-level cell (SLC) NAND solid-state storage solution in a single integrated plastic ball-grid array (PBGA) package. In 8GB and 16GB densities, the 2.7x2.2cm² package offers 63 per

Microsemi's 16GB NAND BGA

cent space savings over a standard CF card of comparable density.

The easy-to-integrate package is said to consume very little battery life compared to hard drives and other larger-form-factor SSD solutions, yet provide fast data transfer.

The BGA is designed specifically for use in the rugged and demand-

ing environments of defense and aerospace applications, providing highly reliable data storage for embedded computing such as that used in aircraft, communications and missiles. The surface-mountable device supports various PATA interface protocols, and an integrated 32-bit RISC flash controller manages wear leveling, error correction and power interruption protection.

Unique ID number could be 'mobile'

The Unique Identification Authority of India (UIDAI) is considering providing an identity that is mobile. "Indians have become mobile. Domestic migration will rise in forthcoming years due to various reasons, including weather. So when we provide a unique identification number, it should travel with them. For instance, if a person from Bihar moves to Kerala, then the number should be valid like your mobile phone," said UIDAI chairman Nandan Nilekani. The UIDAI is looking at using mobile for online identification.

"The UID system has an in-built security and privacy component which ensures that information from the data bank could not be accessed except on grounds like national security," shared Nilekani. He also said the UID could also help in setting up of micro ATMs as part of the government's objective to bring in financial inclusion.
