

TouchMagix Brings Alive Any Surface!

TouchMagix is a combination of hardware and software that makes any projection surface, be it a wall or floor, or even an LCD screen, react to your touch and body gestures

■ VANISHA JOSEPH

A car game is projected on a wall remote-controlled by human movement. The car runs faster and smoother on collecting 'Castrol' fuel packs. Whether you are a gaming freak or not, nearly every passerby would give the game a shot, with many even taking multiple attempts to collect more oil packs to finish first.

At the launch of their new product range, Castrol used this fun and interactive medium, called TouchMagix, to draw and engage crowds of all ages with their brand. TouchMagix, developed by Pune-based startup TouchMagix, makes any projection surface, be it a wall or floor, or even an LCD screen, react to your body gestures or touch.

TouchMagix hardware comprises a high-end PC, a projector and its proprietary TouchMagix sensor. The sensor feeds signals to the PC software, which recognises human gestures/touch and generates an XML feed on loopback interface.

TouchMagix is available in two versions: MotionMagix and Magix-Touch. MotionMagix is a gesture-sensing product that recognises free space movements, like the movement of a hand, and converts the hand location/movement into coordinates for the application to use and perform the action as per instructions. It has two sub-categories called MagixFloor and MagixWall.

MagixTouch, on the other hand, creates multiple touch-interactive dis-

Interactive floor projection campaign for Aircel launch in Gujarat

plays using optical touch technology.

"Our TouchMagix will help brand owners create a long-lasting impression in the consumers' mind. We have successfully reached over 20 countries with our product, replacing numerous traditional and modern advertising/branding technologies. Today, we have 20 direct distributors globally, with three in India (Mumbai, Ahmedabad and Bengaluru)," says Anup Tapadia, founder, TouchMagix.

What's the tech magic?

But what is so unique in the technology powering TouchMagix that makes it change the way brands communicate

with end customer? The accuracy, ability to distinguish between different parts of the human body, content development suite, analytics and cost make TouchMagix a cut above the rest. An R&D team of 20 people—electronics, graphics and content, and software development professionals—put in three years of extensive R&D to develop TouchMagix.

High accuracy results in seamless user experience. TouchMagix uses a combination of hardware and software to take the user experience to greater heights. The MotionMagix product uses a specialised high-speed camera kit, which uses a combination
