

PowerLED Indoor Lights

- Extremely Low power consumption
- Long life (in excess of 50,000 hours)
- Models with light output to match conventional indoor lights
- No maintenance required: very low Lifetime Ownership Cost

PowerLED QR111
Recess Mount

6" PowerLED Downlighter
Recess Mount

2x2' and 1x1' PowerLED Luminaires
Recess Mount

Universal HL PowerLED Strip Light
Replacement for ETL

PowerLED MR-16 Spot
Sealed Mount, Halogen replacement

PowerLED Downlighter
Sealed Mount

PowerLED Downlighter
Sealed Mount

BINAY - Lighting Up The Future

binay opto electronics private ltd.

44, Armenian Street, Kolkata-700 001, India
Tel : (033) 2242 9082, 2210 3807, 2210 2039
Fax : 91-33-2242 1493, Website : www.binayLED.com

INVENTING NEW TECHNIQUES OF PRODUCING LIGHT

called Displax.

Displax Skin is a paper-thin, transparent and flexible film that transforms any non-metallic surface into an interactive touchscreen. The film uses projected capacitive technology and has a controller. It can be applied up to three metres across, and can detect about 16 fingers for a screen as large as 127 cm (50 inches). It is capable of processing multi-touch and even detects if a person blows on it.

Basically, Skin uses a grid of nanowires embedded within the polymer film. Each time a user makes contact with the surface, either by blowing on it or directly touching it, a small electrical disturbance is detected, allowing the microprocessor controller to pinpoint the movement or direction of the air flow.

Skin offers many exciting opportunities, like it could be combined with other technologies to make an LCD unit interactive.

Watch 3-D TV without glasses

Toshiba is developing a new technology for its 3-D televisions that will not require viewers to wear special glasses for watching 3-D movies on these TVs.

3-D TVs now on sale in the market, such as those from Panasonic and Sony, require glasses. But there are already screens that don't require glasses, mainly intended for store displays. These screens require the viewer to stand at specific spots for the 3-D effect to emerge, and the image quality is much lower than of the screens using glasses.

Toshiba's technology involves transmitting different images at various angles to create an illusion of dimension and depth—a principle used by current glasses-free monitors.

New method to better solar efficiency

Stanford University researchers have found a way to simultaneously use the light and heat of the sun to generate electricity in a way that could make solar power production more than twice as efficient as existing methods and potentially cheap enough to compete with oil. Unlike photovoltaic technology currently used in solar panels—which becomes

Photon-enhanced thermionic emission (PETE) process
