

installed at six customer sites for DRAM, Flash and Logic applications, where it is integrated on Applied's benchmark Producer platform.

High-performance bioplastic for electronic equipment

NEC Corporation has developed a first-of-its-kind durable biomass-based plastic (bioplastic) from non-edible plant resources. The bioplastic is created by bonding cellulose, a main component of plant stems, with cardanol, a primary component of cashew nut shells. It has a level of durability that is suitable for electronic equipment and claims a high plant composition ratio of more than 70 per cent.

Looking forward, the company will continue with research and development towards mass production of this bioplastic and improving its suitability for a wide range of electronic equipment within the 2013 fiscal year.

Android phone can double as a supercomputer

Now there is an application for a Nexus One phone that will do almost everything a supercomputer does, and that too without the need for Internet connectivity.

Researchers at Massachusetts Institute of Technology (MIT) performed a series of expensive high-fidelity simulations on the Ranger supercomputer of Texas Advanced Computing Center and then generated a smaller, reduced model, which was used to create an Android application for the Nexus One.

John Peterson, a research associate at the Texas Advanced Computing Center, says, "The idea of using a phone is to show we can take a device with one chip and low power to compute a solution so it comes as close to the one solved on a supercomputer."

Atom processors for storage devices

Atom is the dominant processor used in most of the netbook computers shipping today. As part of a larger plan to get Atom out to other markets

Intel Atom D525 dual-core processor

beyond netbooks, Intel has launched new versions of its Atom processor for network-attached storage devices used in small businesses and home-offices.

The 1.8GHz D425 single-core and D525 dual-core processors are said to boost performance with higher CPU frequencies for faster storage processing and support the new DDR3 SODIMM memory technology. Generally speaking, DDR3 SODIMMs use slightly less power than their DDR2 variants.

The processors are paired with the Intel 82801 IR input/output controller, and offer the ability to support Microsoft Windows Home Server and open-source Linux operating systems.

Eight-socket server for mission-critical computing

Fujitsu has announced the global availability of a new class of industry-

standard servers to drive x86 economical benefits into the mission-critical computing realm.

The PRIMERGY RX900 S1 eight-socket rack server offers the financial sector, public sector and a broadening range of industries with the high levels of reliability for scale-up applications previously dominated by expensive and proprietary RISC/Unix systems. Its in-

novative 'glue-less' design combines with the service offerings and solutions of Fujitsu Dynamic Infrastructures, plus Intel Xeon 7500 processor series and the new Intel QuickPath Interconnect technology, to deliver mission-critical peace-of-mind at an affordable price.

Centralised mission-critical corporate workloads can be deployed on the RX900 S1 with peace-of-mind for extreme performance requirements, as the rack server scales up on demand inside a single 8U chassis, without the need for change or rearrangement of rack infrastructures. Processing power is assured by up to 64 processor cores, up to 2 terabytes of main memory, and a highly-aggregated input/output bandwidth of more than 120 gigabytes.

Online radio on your PC

The full-fledged media players or browser media players, which play music from the files residing on your PC and different sources over the Web, also eat up computing resources.

But if you have a Linux desktop, you can download a free and light-weight online radio streaming player named Radio Tray that has a simple interface to play music from online radios. This uni-tasker runs on a Linux system tray and supports most of the popular media

Fujitsu PRIMERGY RX900 S1 rack server
