

True notebook mobility occurs not when the connection becomes wireless, but rather when the connection becomes wireless and untethered from a physical location. Wireless wide-area data services—specifically 3G service offerings—offered by the major cellular carriers are making true notebook mobility a reality today. And notebook manufacturers like Fujitsu have realised that, just like 802.11, wireless wide-area capabilities need to be embedded into notebooks to optimise the usability and manageability of the technology.

Pallab Talukdar, CEO, Fujitsu India, spoke to Uma Bansal, deputy editor at EFY, about the importance of 3G-ready laptops, how these will revolutionise the mobile workforce and their plans for India.

“3G SPEEDS SUPPORT LIVE VIDEO STREAMING TO NOTEBOOKS”

Fujitsu entered India last year. How has been the journey so far?

It has been quite an interesting journey though we have been relatively a newcomer in the market. Our products have got very good acceptance as they are designed and manufactured in Japan or Germany.

What are your areas of operation?

We are focusing on infrastructure platforms including products like notebooks, tablet PCs, thin clients, workstations, servers and storage. On top of that, we have infrastructure solutions, which are hardware and software products typically deployed in datacenter environments.

How much is the focus on notebook PCs?

We are one of the pioneers in the notebook computing

world. Touchpad incorporated in notebooks is originally a Fujitsu innovation. We have some unique features in our notebooks, like 100 per cent biodegradable plastics and 3G capability. Currently, a big part of our business is focused on notebooks.

With already established players in the IT market, what would be your strategy to acquire the market share?

We are not playing the price game. Rather, we believe in value proposition—quality and innovativeness. So Fujitsu is positioned as a high-end premium notebook player in the market.

You have launched 3G-ready laptops in India. Ideally for whom is the Internet over 3G mobile networks meant for? What's the thought behind launching 3G-ready laptops?
