

BINAY - Lighting Up The Future

BINAY LED-based HIGH, MEDIUM and LOW Intensity Aviation Obstruction Light Beacons

As per International Civil Aviation Organisation (ICAO) requirements Available in Low Intensity, Medium Intensity and High Intensity versions (as per International Civil Aviation Organization guidelines), BINAY's patented LED Aviation Lights come with 5-year/3-year warranties

LED Obstruction Lighting for:

- Industrial chimneys and smokestacks
- Transmission, microwave and cellular towers
- Radio, TV and similar structural towers
- High-rise buildings and structures
- Airports and airfields

The BINAY LED Aviation Obstruction Light offers the following advantages:

- Fit-and-forget maintenance-free operation
- A long life of 100,000 hours (20 years at 12 hours daily burning)
- Pays for itself within a short period of operation in the form of reduced installation, maintenance and servicing costs
- Quick Installation; Reliable operation 365 days per year
- Shock-proof and vibration-resistant
- Over-Designed Intensity to allow for natural LED intensity degradation over its operating lifetime

THE BINAY LED OBSTRUCTION LIGHT IS UNDER ACCEPTED PATENT, AND AS SUCH IS A PROPRIETARY PRODUCT

POWERING LED TECHNOLOGIES WORLDWIDE SINCE 1983

3D printing tech helps devise Braille maps for the blind

Jason Kim, a senior mechanical engineering student in Department of Mechanical and Aerospace Engineering in Rutgers' School of Engineering, USA, along with his professor Howon Lee, has designed a 3D-printed Braille mapping

system for the visually impaired. This design will enable the blind to understand the surroundings of Joseph Kohn Training Centre in New Brunswick. The system will be embedded in each story of the local training centre.

One of the biggest challenges faced by the visually impaired is to recognise the correct directions to the destination. Moreover, orientation of objects in its surroundings might get in the way and indirectly interfere with the pathway.

The computer tablet size map is very cost-effective. Using one single pamphlet, the user will get a ready-made picture of the building.

Head cap that could enhance human skill-acquisition capacity

Dr Matthew Phillips and his team from HRL laboratories has successfully incorporated brain activity patterns of commercial and military pilots inside a novice test subject who had little idea about flying aircrafts. Owing to transcranial direct current stimulation (tDCS) technology, test subjects were able to learn how to pilot an airplane in a realistic flight simulator.

Dr Phillips said that, in order to realise their goal, they glued an electrode-embedded head cap on the subjects. Ultimately, they compared the measured value of the
