

there is nothing stopping you from doing a 3D animation.

The extras. A feature called Overlay Object can be used in the graphical display as position references, since these are positioned at the corner of a view window and do not move when the view is panned or zoomed. The software also generates graphs of selected parameters to help study behaviour in detail. You can even save a video of a model in operation, which can later be viewed on VLC player. As the generated video format is not compatible with all software, and is slightly on the higher side when it comes to storage space, developers recommend using software such as HandBrake for professional purposes.

Simulating a hydraulic generator, maybe

If the problem at hand involves dealing with fluids, a fluid objects palette in JaamSim provides exclu-

sive objects for building dynamic models. The objects allow for details right from defining properties of the fluids under use, to fluid flow between source and destination, vessels for storage, pipes for transportation and also centrifugal pumps.

Taking a cue from experience

An extremely-fast simulation software that Jaamsim is, it lets one

scale it to the largest of applications. Once you are familiar with the language and the tools, you can create additional palettes of high-level objects for advanced requirements. The developers have built the software with over 35 years of simulation practice, with every lesson learnt inculcated into the tool in some form.

Built on this strong background, alongside a neat website (www.jaamsim.com), developers have gone on to start a company, JaamSim Software Inc., to develop, promote and offer support. Enough said! Looks like JaamSim is already inviting you to jump in and try your hand at simulation, if you have not already. **EFY**
