

compared to traditional solid-state drives and has non-volatile memory. Although slower in performance, it could save a lot of boot time and battery.

Build quality. About 90 per cent of laptops are made of acrylonitrile-butadiene-styrene engineering plastic. The underlying factor is cost and durability. This plastic is an alloy of polycarbonate and acrylonitrile-butadiene-styrene, and is quite cost-effective and durable. Some laptops have shells made of polycarbonate plastics that give these a metallic resemblance and finish.

Heat produced. Fanless PCs are a sensible purchase, and that is what these low-priced laptops are. These have processors optimised to consume less power. For example, a very fast desktop processor such as Intel Core i7-4960X has a thermal design power of 130W, which is hot.

Laptops used to have 45W or 35W processors, which fell to 15W to 17W for thin machines. Intel's Core M range brought that down to 4.5W. Today, even cheap Intel Atom based chips (often Pentium or Celeron branded) run at 6W to 10W.

Battery backup. This segment of laptops has a good amount of battery power. There are laptops that have more than five hours of battery backup. The processor, eMMC, lack of disk drives, low-power-consuming processors and so on save a ton of battery juice.

Not for leisure. An average person would use a computer for leisure for about half an hour every day. Entertainment value of such a laptop is comparatively low as it is not designed to be used for intense multimedia applications. A good multimedia laptop must have a dedicated graphic processor, a minimum of 8GB RAM and 256GB solid-state drive.

Worth your buy

Here are some laptops that you may look at from companies that are

brave enough to give good products at the best prices.

Budget laptops. ASUS does a really good job of offering good configurations at pocket-friendly prices. They claim that their best laptops at lowest prices run on Intel i3 processors with 4GB RAM. All laptops in this range house at least 500GB hard drives, and HD LED screens give a crisp and clear display for better visuals.

Productive in all aspects. Lenovo sticks to a good build quality and, without losing its elegant looks, offers some good laptops in this segment. Powered by dual-core two megabytes of cache and provision for extending RAM memory, these could be the best buy for professionals.

Stylish and compatible. Laptops from Hewlett-Packard are power-packed to be compatible with all kind of users. Combined with good looks, the laptops are stacked with adequate processing power and standard storage space of 500GB and above. Build quality and hinges have been improved over the years without losing on style quotient.

Light on pocket and portable. Acer has an interesting range of laptops that would not burn a hole in your pocket. Promising more battery backup, Acer provides all essential specifications for commendable performance at the lowest of prices. Acer gives you a wide range of low-priced, lightweight laptops to choose from, while keeping up with specifications.

Performance and durability that go hand in hand. Inspiron series of laptops from Dell are known for performance and durability. The laptops are amazingly sturdy and most suitable to run open source operating systems like Ubuntu and Linux. These suit all kinds of users, from working professionals to academia.

The lifespan of these entry-level laptops depends on how you treat these. **EFY**

SHAVISON™

Peripherals for Industrial Automation

- Black SMPS
- Digital Timers
- Analog Timers
- Hooters with Flasher
- Battery Charger
- Relay Interface Modules
- SSR Interface Modules
- FRC/ D-SUB connector
- Modbus I/O Modules
- Opto Interface Modules
- Power Distribution Modules
- Redundancy Modules
- Diode/ Resistor Modules
- Analog Signal Converters
