

Allegro LED Driver ICs for Automotive Lighting Applications

Allegro's portfolio of wide input, Q-100 qualified LED driver ICs are designed to address the emerging requirements of lighting applications within the automotive and 2-wheeler markets.

The family of linear programmable LED current regulators can drive single to multiple LED strings over a wide range of currents. As an example, the A6274/84 is designed to extend a linear solution to higher LED power without the need for a switching regulator, thus saving component count and facilitating simple EMI/EMC compliance.

Allegro also has a family of Buck LED drivers, with drive capability up to 3A. Availability of high-side or low-side current sensing, internal or external PWM capability, frequency dithering for EMI/EMC compliance and other features and functions are covered in this broad portfolio. To drive higher current and/or operate in boost or buck-boost topologies, there is also a family of Controller ICs utilizing external FET for scalability.

Key automotive & 2-wheeler applications include:

- Stop/Tail Rear Combination Lights (RCL)
- Daytime running lights (DRL)
- LED headlights
- Turn signals
- Front/rear fog lights
- Position lighting
- Rear "appliance" lighting
- Puddle and side-mirror lighting
- Interior lighting – dome, footwell, ambient
