

ROBOTS NEED SOFTWARE That Are Bundled In This DVD

SHANOSH KUMAR

Gazebo

The first thing that runs across a robot developer's mind is the design of a robot followed by its simulation. To get to a better design in time, this software helps realise your robot as quickly as possible. Equipped with a robust physics engine, high-quality graphics, programmatic and graphical interfaces, Gazebo is a powerful open sourced, apache-licensed complete simulation solution. It answers the pain point of operating robots in presence of gravity so that they do not fall down and damage themselves. Advanced 3D graphics, virtual sensors, command-line tool collection, ability to run extensive simulation and plugins in this application can get you started in no time.

V-REP Player

Everybody calls this software the 'Swiss army knife among robot simulators.' It facilitates fast algorithm development, factory automation simulations, fast prototyping and verification. Garnished with elaborate application interfaces, this robotic simulator has an integrated development environment based on distributed control architecture that solves the problem of individually controlling each object through an embedded script, a plugin, an ROS node and a remote API client.

PEDA

PEDA categorises itself into an exciting PCB software with a unique tools selection stack for manual routing and unified PCB schematic database developed in Qt4 library. This software is similar

Some popular resources

ProReports. This is a computer system designed to generate reports in office formats such as PDF, XLS, RTF, HTML, TXT, XML and CSV. In simple words, ProReports makes the reporting system a fun and easy activity. Instead of running a bunch of lengthy commands, it helps to organise everything into a graphical user interface.

It supports jxrm (JasperReport) format. Jasper report formats can be used in Java-enabled applications, including Java enterprise edition or Web applications, to generate dynamic content. You can prepare a report in the internal format of ProReports with the help of simple visual programming language mixed with PHP and JAVA.

GIMP (version 2.8.18). GIMP is an acronym for GNU Image Manipulation Program. It is a freely-distributed program for editing tasks such as photo retouching, image composition and image authoring. This tool can be used as a simple paint program. GIMP is equipped with expert-quality photo-retouching program, an online batch-processing system, a mass-production image renderer and an image format converter, too. GIMP was originally written and developed under X11 on UNIX platforms. It also runs on Windows and Mac OSX platforms.

to Orcad, GEDA or Kicad platforms in functionality. It helps in a faster and more reliable process of designing boards while saving time and board re-spins.

Argos

SCADA software in the industrial world is developed to help you attain supervisory control and data acquisition (SCADA). Likewise, Argos facilitates in remote monitoring and control while operating on coded signals over communication channels.

This free open source software has been developed for Linux operating systems. Argos SCADA communicates with automation devices such as a programmable logic controller, distributed control system, programmable automation controller PAC, PC/104 and Arduino boards. It has based its integrated development environment on fast light user interface

designer to bring in appealing visual effects and added visibility.

MRPT

The mobile robot programming toolkit (MRPT) is a platform that helps you develop and design algorithms that work on simultaneous localisation and mapping, computer vision and motion planning, facilitating obstacle avoidance. It acts like a cross-platform, and its open source C++ library is aimed at robotics researchers.

Its toolkit provides developers with portable, well-tested applications and libraries covering data structures and algorithms. This utility software is easy to code and has classes written in C++. Most programmers who work on these robotic platforms will find it easy to comprehend, and it thereby helps produce better programming strategy.

Smart Soft Robotics

Smart Soft Robotics utility software provides a component based approach to developing robotic projects. It bases itself on communication patterns as the core of its robotic component model. Its software framework can assist component developers, application builders and end users in building and distributing components equally in a way that semantics of the interface of components is predefined by the above-said communication patterns. The dynamic wiring of components at run-time is explicitly supported by the wiring pattern that differentiates this software from others in this segment. **EFY**
