

Now BINAY White-Tunable Vario-White Circadian PowerLED Lights can enhance your health

BINAY Human-Centric Circadian Vario-White PowerLED Lights With **Adjustable Colour Temperature** are designed to affect the human circadian rhythm positively for enhanced physical and mental well-being

Binay Opto Electronics Pvt. Ltd.
27, PANDITIA TERRACE, Calcutta 700 029, India
Telephone: +91 (33) 4006 9875, 2475 0392, 2475 0030
Email: info@binayled.com, Fax: 91-33-2242 1493

BINAY Multichip LED Lamps
High reliability direct-retrofit LED bulbs for Control and Instrumentation applications

Simple retrofits for existing filament bulb holders, in applications such as annunciator window (fascia) backlighting and illuminated pushbutton switches, where the reliability of indication is important or where lamp replacement is difficult or expensive

- Long life (typically 100,000 hours)
- Low power consumption;
- Low heat generation
- High brightness and wide-angle light emission
- Shock-proof and vibration resistant
- High reliability of indication
- One-time Expense

POWERING LED TECHNOLOGIES WORLDWIDE SINCE 1983

Shape-shifting touchscreens morph on demand

Imagine that you launch a gaming app on your smartphone, and the device automatically morphs into the shape of a console. Then, if you receive a text message and need to respond, it transforms itself back into a phone.

Cubimorph can change shape on demand

Researchers at University of Bristol, UK, have designed a device that could one day do just that. It is called Cubimorph, and is a small, modular device that can change into different shapes, depending on the desired function or even the person holding it. Its designers say that the technology could pave the way for more adaptable handheld gadgets.

Cubimorph looks a bit like a Rubik's Cube and is made from a string of connected smaller cubes, with each surface covered in a tiny touchscreen. The cubes are on hinges that allow movement across any of the edges controlled by two motors.

Microbots that can hitch-hike

Scientists at Harvard University, USA, have developed flying microrobots that can use static electricity to perch on bats, birds or butterflies to conserve energy in long-duration flights.

The team at Harvard has used electrostatic adhesion, which is the same basic property that causes a static-charged sock to cling to pants, or a balloon to stick to a wall.

Moritz Graule, a researcher on the project, has said, "In the case of balloons, charges dissipate over time and the balloon eventually falls down. In our system, a small amount of energy is constantly supplied to maintain the attraction."

RoboBee uses an electrode patch and a foam mount that absorbs shock. It takes off and flies normally. When the electrode patch is supplied with a charge, it can stick to
