

How MODERN TECHNOLOGY Is Revolutionising The ACADEMIC SECTOR

Saurabh Durgopal is working as technology journalist at EFY

Dilin Anand is a senior assistant editor at EFY. He is B.Tech in ECE from University of Calicut, and MBA from Christ University, Bengaluru

All college graduates leave the final year with hopes of joining some prestigious firm and making a name for themselves in a field of their choice. But they often hit a roadblock at the point of required skills for the job. Why is it so?

"Colleges teach 8051 microcontroller (MCU) as part of their curriculum," says Surya Compella, founder of Kriyative-Edge, "and when it comes to looking for job opportunities, fresh graduates often do not have enough knowledge about the latest tech being used in the corporate world."

Digging into the problem

Talking to the people currently catering to the field of education, major concerns raised are related to practical knowledge. "Current practical classes at colleges are based on viva and not hands-on experiments," says Manish Joshi, deputy chief

executive officer at Sciencetech. Now that is ironic.

The same has been seen in many colleges. Students are not allowed to use calculators till class XII, and are then expected to use an oscilloscope efficiently in the first year of graduation. Additionally, "Today, students require knowledge on multiple aspects to get hired for a particular technology," says Dr Jonathan Joshi, chief executive officer, Eduvance.

The age of T-shaped skills for engineers is here, and working hard is just not enough. Learning smart has become the priority.

How academia is tackling this challenge

Smart classrooms enabled with truly modern equipment seem to be the potential solution. In order to understand this, let us consider a traditional case where, while teaching a class of 45 to 50 students, a teacher has to consider the entire class as a group of equals. This somewhere leads to below- and above-average students being ignored, since the majority of any class is average.

Specifically for higher education, smart learning methods like developer boards and e-learning tools have been claimed to be of a huge help by our contributors. More so because technical education requires getting your hands dirty. Pranay Kishore, founder - director, PhiRobotics Research Pvt Ltd, says, "Electronics is something you learn with hands-on experience." Investing in technology, and more specifically the right technology, leads to the best learning. So let us take a deeper look at the new demand trends for technology from academia.

Get students actively involved with development kits

Ease of use with developer boards and compatibility with multiple programming languages are some of the factors that make it interesting for students.

e-learning encompasses electronic technologies to access educational curriculum
