OrCADLite

OrCAD is a proprietary software tool suite used primarily for electronic design automation (EDA). It is used mainly by electronic design engineers and electronic technicians to create electronic schematics and prints for manufacturing printed circuit boards (PCBs).

OrCAD Lite package lets the user experience all features and functionalities of the actual software. This package of OrCAD Lite is bundled with demo versions of OrCAD Capture (schematic design solution for the creation and documentation of electrical circuits), OrCAD CIS (component information system for component data management), OrCAD PSpice A/D (Spice based simulator for system design), OrCAD PSpice Advanced Analysis (used for temperature, stress analysis and electro-mechanical simulations), OrCAD PCB (scalable PCB design solution) and SPECCTRA (proven interconnect solution for improving routing quality and productivity).

OrCAD Lite is fully functional and offers every feature of OrCAD, limited only by the size and complexity of the design.

CometCAD

CometCAD is a tool for creating circuit schematics and PCBs. With the tiny green board inside every electronic system deciding the complete functionality of the system, creating worthy designs take priority. CometCAD is built for Windows and falls under free-use licence.

Design of the PCB using this

software is divided into three stages: symbol, circuit and layout. The tool facilitates the creation of new PCB layouts from scratch or updation of an existing PCB file. This is called forward annotation. Every PCB layout requires a circuit schematic as input, and on importing the same, CometCAD allows users to estimate the area of the final PCB. The layout editor allows them to edit the different layers of the PCB.

PCB123

PCB123 is a software tool for PCB designing. Built with a robust feature set and with over 40-plus years of manufacturing, the tool helps users with design processes and getting the PCBs manufactured. The 3D section of the tool lets users visualise the changes to be made to the schematic or layout, essentially before PCB manufacturing stage.

eCos

This software is finding its space in the Internet of Things (IoT) zone and many developers prefer such platforms that are lightweight and easy to implement and deploy. Easy integrations are an add-on to their capabilities.

eCos is a free and open source real-time operating system used in many embedded systems and applications worldwide. It is mostly used to run applications that need a single process but multiple threads. The design of eCos allows users to customise it to precise application requirements, be it run-time performance or hardware specificity. Implemented in C/C++ , eCos

provides them with compatible layers and APIs for POSIX and µITRON.

Winlog 3.01

WinlogLite is the free version of Winlog Pro SCADA software. These are flexible and easy-to-use software packages, convenient for development of SCADA/HMI applications with Web server support. WinlogLite includes various static graphic symbols and supports animated graphical objects through Industrial Gadget ActiveX. The tool facilitates development and execution of Web applications.

Like every lite version, WinlogLite provides users with most functionalities, but it now allows development of applications having more than 24 tags. This version of WinlogLite includes graphical libraries, Symbol Factory and Industrial Gadgets ActiveX in Demo mode.

Pinguino

Pinguino integrated development environment (IDE) is a standalone application built with Python. The integrated pre-processor translates specific Arduino instructions directly into C language. This pre-processor reduces the code length and increases the execution speed.

Pinguino IDE is supported by C compiler (SDCC for 8-bit MCUs and GCC-mips-elf for 32-bit MCUs), assembler and linker (GPUTILS for 8-bit MCUs, BINUTILS for 32-bit MCUs) and a USB bootloader (based on Microchip USB HID bootloader for 32-bit MCUs) to process such applications. **EFY**
