

ferent parts of the design. While it is not uncommon to have a design spanning more than a single sheet, CometCAD provides off-page connectors to establish continuity between pages.

An error check to be sure

Every PCB design is based on specifications given by the manufacturer, and the design you create is put through an error check. At this stage, the design and all its connections are cross-checked against the rule file given by the manufacturer, and errors are identified.

CometCAD does not allow you to generate the output file until and unless the design undergoes a check. Outputs created are all computer-aided manufacturing (CAM) files. Gerber and mill files are also created, along with required reports. Depending on the type of PCB panel selected, the PCB borderline and PCB area overlap is selected.

This completes our journey from symbols to layout. Go ahead and get your PCB made. You can even create a double-side PCB or a dual-layer

PCB. Your very own hardware is just weeks away! **EFY**
