

With more players about to launch their VR headsets, it would be interesting to see how much the prevailing cost of these devices will be. Increasing competition and advancements in technology over time should allow for a reduction in the retail price in future.

Applications beyond the realm of gaming

While gamers seem to have the most to be excited about when it comes to VR, it is essential to see the applications of this new technology beyond the gaming world. The possibilities are endless and it is only a matter of time before different industries find a use for VR gadgets.

In terms of manufacturing, VR headsets can help optimise the process of engineering, designing and manufacturing a product. For

Vive VR gear

instance, Ford uses virtual testing and prototyping. By eliminating the need to create a physical prototype, companies can save thousands upon thousands of dollars while enhancing productivity at the same time.

The real estate industry has also found a way to take advantage of

VR gear. Brokers and developers set up VR tours that show clients what a particular building would look like. This can tremendously speed up sales.

The future is here

2016 has become a lot more exciting, thanks in large part to the much-awaited launch of VR headsets. It is akin to the time when smartphones first gained ground and we have all witnessed how mobile devices improved in quality in a very short span of time. Manufacturers say that they are just focusing on the basics right now, which means that we are only at the tip of the iceberg. Perhaps it is time to take a step into the virtual world and see how it can transform lives as we know it. **EFY**
