

- Collaborative PCB design verification tool
- Decrease design reiterations, enhance productivity

PollEx PCB

Do you want to see any design data? PollEx PCB is a good partner for your work!

PollEx PCB allows users to view all PCB design objects in detail. PollEx PCB quickly reads entire PCB design data and provides users with convenient ways to explore the design details. Its flexible and intuitive GUIs allow users to easily view and modify ECAD files in various formats.

Supports All Major ECAD Formats

Vendor	Product
Altium	PCAD / Protel
Cadence	Allegro Spectra Quest ORCAD Layout
Mentor Graphics	Board Station / Neutral File Expedition PADS ODB ++
Zuken	CADSTAR CR5000 Board Designer CR5000 PWS CR8000 Design Force

PollEx Thermal

PC board level thermal analyzer. After Analysis, check the Thermal Effect on PC board

PollEx Thermal is a fast, accurate, and easy-to-use finite element thermal validation program for analyzing PCB designs. It allows users to detect and correct thermal problems during design stage so that costly design iterations are eliminated or significantly reduced.

PollEx SI / SI Explorer

After analysis, reviewing Signal on PC board

PollEx SI (Signal Integrity) is a fast, accurate, and easy-to-use signal integrity validation program for analyzing PCB designs. It allows users to detect and correct signal integrity problems during design stage so that costly design iterations are eliminated or significantly reduced.

- Transmission Line Analysis
- Network Analysis
- Data Line Analysis
- ADD/CMD/ENTR Line Analysis
- Automatic DDR BUS Analysis
- Crosstalk Analysis
- Net Topology Analysis

PollEx DFE (Design for Electrical Engineering)

Validation system for electrical defect of design stage

PollEx DFE is rule-based PCB verification software for electrical engineers. It consists of Pre-Processor, Running Core, and Post-Processor. Pre-Processor is used for setting input parameters. Users can define rules or classify and register groups or classes for nets and components. Running Core checks the rules against PCB design data. Finally Post-Processor is employed for reviewing the checked results.
