

Delphi unveils 48V vehicle solution to meet emission norms

Automotive parts manufacturing company Delphi has unveiled its 48-volt vehicle solution that could prove pivotal for automakers in meeting future emission regulations without sacrificing performance for customers. The company confirmed it is working with two global automakers and could see production within 18 months.

Showcased in a Honda Civic 1.6-liter diesel vehicle at

the company's annual investor update, Delphi's 48-volt, mild hybrid technology enables 'intelligent' electrification. The customised vehicle architecture maximises the use of the 48-volt electrification to minimise the demand on the engine, improving performance while lowering CO₂ emissions by more than ten per cent.

Software simplifies detection of activity on mobile and wearable

STMicroelectronics has made additions to its Open. MEMS portfolio of free and easy-to-use software libraries for the development of motion-sensing applications. This provides an ideal route to implementing contextual awareness in mobile, wearable and Internet of Things applications.

The new software allows the detection of human activities from data acquired by inertial sensors embedded in the end-user equipment. Optimised to minimise power consumption, these are particularly suited for fitness and healthcare applications in portable or wearable platforms that monitor human physical activities in real time over long periods.

The osxMotionAR Activity Recognition package identifies the user activity from a wide range of movements and transportation scenarios such as stationary, walking, fast walking, jogging, cycling, and driving. The osxMotionCP Carry Position package detects how the device containing the motion sensors is being carried, that is, whether it is placed on a desk, held in hand or in a swinging arm, near the user's head, or put in a shirt or trouser pocket. The osxMotionGR Gesture Recognition package recognises the actions carried out on a mobile or handheld device, including pick-up, glance, or wake-up, which allows designers to develop controls for different functions on the device.

The new Open. MEMS packages are available free of charge to customers through a simple click-through licence agreement.

BINAY Multichip LED Lamps

High reliability direct-retrofit LED bulbs for Control and Instrumentation applications

Ba9s bayonet pin cap	E-10 screw cap
Midget Flange cap	Midget Groove cap
5530 and 6844 slide base	Wedge base

Simple retrofits for existing filament bulb holders, in applications such as annunciator window (fascia) backlighting and illuminated pushbutton switches, where the reliability of indication is important or where lamp replacement is difficult or expensive

- Long life (typically 100,000 hours)
- Low power consumption;
- Low heat generation
- High brightness and wide-angle light emission
- Shock-proof and vibration resistant
- High reliability of indication
- One-time Expense
