

Wireless fencing

The main unit/transmitter for the wireless dog fence plugs into a regular outlet in your home and emits a radio signal from that location, which becomes the centre of a safe zone. The radio signal has limited range, which can be adjusted from about 9.1m to 45.7m (30 feet to 150 feet), and this circle is your safe zone.

The wireless dog fence comes with a special collar that the dog wears. It contains a receiver, which receives signal from the main unit. As long as the collar is receiving a signal, the dog is free to be anywhere in the safe zone. When the dog approaches the outer perimeter of the safe zone and moves into the warning zone, he or she receives a warning beep. If the dog continues to move away from the main unit and does not move towards the centre of the safe zone (the transmitter), the canine receives a static correction that is not harmful but does startle him/her. With a little training, the dog learns to move away from the boundaries at the sound of the warning beep and avoids static correction.

Safe zone of the wireless dog fence, because of its design, is necessarily a circle. It cannot be adjusted to be any other shape. This is the wireless dog fence's most-limiting characteristic, because in some cases, a circular-shape safe area just does not work.

Petnet smartfeeder

Petnet is one of the most famous smartfeeders available on the Internet today. With the system and feeder, you can manage multiple things like the time the pet is fed, the portion he or she is to receive, determine ingredients that are important in the diet and have automatic delivery so you do not run out of food.

By using the smartfeeder application, you can get meal confirmations, details on remaining food supply and preset times for feeding. You can also feed your pet from anywhere using

a smartphone. The system lets you choose food based on age, weight, breed and activity level to make healthier decisions for the pet.

The feeder uses a Wi-Fi module with IEEE standard 802.11 b/g/n at 2.4GHz. It also has a built-in rechargeable battery and comes with a chew-resistant USB cable and AC adaptor. The application requires iOS 8 or later for iPhone users.

FitBark

FitBark is a health-monitoring device that monitors a dog's everyday activity and sleep. It turns all data into BarkPoints so you can track progress. One can open the application and get real-time updates on the dog and see if the dog is sleeping, walking or running.

It uses a Broadcom chip for processing and a low-energy Bluetooth module with Bluetooth 4.0 for synchronisation. It uses a 3-axis accelerometer to detect movement and has a rechargeable lithium-ion-polymer battery. The application requires iOS 8 or later for iPhone users and Android 4.4 or later with Bluetooth 4.0 for Android users.

Electronic SmartDoor

Electronic SmartDoor gives the pet a key to the house so he or she can come and go as wanted. Using RF technology, SmartDoor reads the unique signal of SmartKey worn on the pet's collar and triggers the battery-power-driven flap to unlock. When SmartDoor no longer senses SmartKey, the flap automatically locks back into place. Each key is programmed to only let that pet use the door, so other pets or stray animals cannot use the pet door.

SmartDoor can detect up to five programmed SmartKeys, which are waterproof, and also operates in two other modes: fully-locked mode and unlocked mode. Locked mode does not allow entry or exit for any pet and unlocked mode allows entry and exit for all pets. **EFY**
