

RAISING THE BAR IN HIGH-RELIABILITY ELECTRONICS

Few companies can lay claim to having an ability to be artistic and drive the cutting edge in technology at the same time. Semiconductor manufacturer ROHM Co., Ltd is an example of such a firm, which supplies high-quality and high-reliability electronic products worldwide while at the same time maintaining the ROHM Music Foundation, to develop cultural music.

What does ROHM signify?

“R” represents the first letter of ROHM’s original main product, the resistor. This was put together with the unit for resistance, “ohm”. Today, the company has advanced with time and the “R” now also stands for “Reliability”. “Quality First” remains the cornerstone of ROHM’s corporate policy.

Awards & Recognition

Coming as no surprise, the Continental Automotive Group in Frankfurt honoured ROHM Semiconductor with their “Quality Award.” This is a prestigious award given to suppliers from the electronics and mechanical engineering sectors in recognition of outstanding performance in quality improvement. ROHM was also honoured with the “Bosch Global Supplier Award,” by Robert Bosch GmbH in recognition of outstanding performance in the manufacturing and delivery of products or services.

Growing roots in India

“Only good products can be sold in India with good support. That is why

we started the technical support application engineering team here. With this good support, we can recognise and achieve new possibilities for demand growth in India,” explains <spokesperson>.

ROHM started their India operations in 2006. While the first five years were mainly focussed on improving their distribution system, in 2011, they established three sales offices located in Bengaluru, New Delhi, Pune, and Chennai.

Increasing customer value

“We conducted their market calculation and demand creation in India for the next five years, to make sure their strategy for India is solid,” added <spokesperson>.

In order to grow from here onwards, ROHM aims to have products that match the India requirements. In order to achieve this, they are focused on perfecting two key areas.

Application optimisation: Various products will be specially optimised

for specific applications, thus making them an even better solution for design engineers considering integrating ROHM products into their design.

Support: ROHM understands that while most engineers can get a design to work, the real challenge is in getting the design into mass production. Keeping this in mind, they realised

that local customer support is very important to their customers and as a result this is a key area where they will focus on.

Products & Technology for India

There are three broad areas where ROHM would be focussing on.

- Automotive
- Power
- Motor

IGBTs and SiC: They are promoting the popular field-stop insulated-gate bipolar transistor (IGBT) of automotive grade. These IGBTs are already on Indian roads with ROHM solutions. Low power consumption, being a key area across verticals, ROHM offers a broad portfolio of motor drivers for brushless DC (BLDC) motors. These have the benefit of using IGBTs and Silicon Carbide (SiC) to reduce power consumption on appliances running these motors.

CDI transforming to TCI: More than 60 per cent of the fuel used
