that you can import these into your program. Register on Twilio website to obtain Twilio phone number, account SID and authorisation token. These are required in the source program to send text messages.

Then, register on OpenWeatherMap website and obtain a key. This key is required to read weather details from the website.

Install Twilio package

Twilio package can be easily installed in Windows using pip installer. This comes pre-packaged with Python 2.7.11. So you do not have to install it again. To download and install Twilio, run Command Prompt as Administrator and type the command shown in Fig. 12.

Fig. 16: Install PyOWM

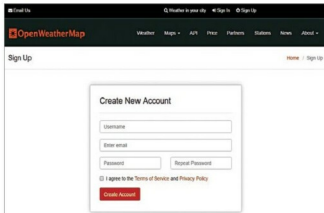

Fig. 17: Create new account in OpenWeatherMap

Note. It is important that Command Prompt is run as Administrator. Otherwise, the command will not work.

To check proper installation of Twilio, run Python in Command Prompt and type the command given below:

```
>>>import twilio
```

If this command does not give any error message, it means Twilio is properly installed.

Register with Twilio. Follow the steps given below to register or sign up:

1. Go to www.twilio.com and click Sign Up (Fig. 13).
2. Fill in your details in the form and click Get Started. (Choose Py-

thon as language).

3. Twilio will ask your phone number; enter it on the next screen.

4. Log into your account with the username and password you created.

5. You will see the dashboard as shown in Fig. 15. If you do not see all the details on your console dashboard, you can navigate to Account and find everything there.

6. Note down account SID, authorisation token (click Lock to get it) and Twilio phone number (click Phone Numbers to get it).

Install PyOWM Python package

This package will be used to read weather details from OpenWeatherMap website (<http://openweathermap.org/>). Install it by using the commands shown in Fig. 16.

Register with OpenWeatherMap

To obtain the key, just sign up with the website by submitting your details (Fig. 17) and sign into your new account.

Click on API Keys and note down your key.
