

Fig. 4: AccuVein device

Fig. 5: Medical care using Google Glass platform

displays the vasculature on the surface of the patient's skin in real time, allowing doctors to verify vein patency and avoid valves or bifurcations. AccuVein is a hand-held scanner that projects over the skin and shows various veins and their valves in the patient's bodies, which cannot be projected in case of cosmetic procedures.

Features of vein illumination with AccuVein device are:

Easy to learn and use. No pre-use calibration or adjustments are necessary; it can be used immediately.

Small size. The device fits in your hand and weighs only 283.5gm (10-ounces).

Hands-free option. In situations that require hands-free use, the device can be placed in a wheeled hands-free accessory or one that quickly attaches to a chair or bedrail.

No patient contact. Because the device has been designed to be non-contact, it may not have to be sterilised after every use.

Works in light or dark. You can use the device in light or dark/light environments.

Rechargeable battery. The device does not need to be plugged into an electrical outlet.

Movement tolerant. Because the device shows veins in real time, when operated properly, it can accommodate resident movement.

AccuVein is a breakthrough medical imaging device that is quickly becoming an indispensable tool for all healthcare professionals who perform venepuncture procedures. Small and portable, AccuVein allows them to quickly find a patient's vein without undue hassle or trauma to the patient. This can be particularly helpful for those patients who have difficult venous access.

AR based patient care. AR is laying a deep foundation for surgeons to have proper patient care by getting the right information at the right time and place for effective care. In Boston (USA), physicians at Beth Israel Deaconess Medical Center have made use of secured Google Glass to overlay helpful clinical data to examine patients. The goggles are triggered by a QR code outside the patient's room and can pull in electronic health record information ranging from nurses' notes to lab results.

European app maker Droiders wants to bring AR into operating rooms with Google Glass platform called MedicAR. Using this, surgeons could direct their goggles at a target on their patient—typically a small temporary tattoo—and view a real-time AR display on their screens.

To their eyes, they would see the procedure illustrated step-by-step with CT/MRI images, notes and diagnostic information perfectly superimposed over the patient's skin. **EFY**

RISHABH

Features

- Hinged & Integrated wire sealable terminal cover
- Dual connection facility for secondary
- Various mounting options like Din Rail, wall and Bus bar mounting
- Wide range of primary current ratings
- Self lifting terminal clamp & screw assembly for secondary
