

two ways, either with clinical trials or with clinical studies. Clinical trials are large-scale, but in the case of clinical studies very few people are involved. A clear-cut plan is required for clinical engagement, and the plan needs to be approved by the DCGI as well as hospital committees.

Designing in India is different

Ultimately, it is important to keep in mind that designing medical devices in India is a completely different process compared to the rest of the world. In India, the market is doctor-driven. Even though consumers are the real users of all medical devices, they are not the final decision makers. Doctors are the ones who decide which products are going to be used.

There is also the issue of varying rules and regulations for each state in India.

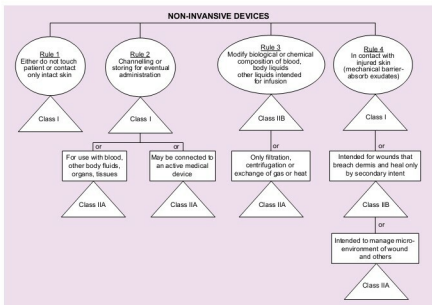

Fig. 2: MDD classification chart for non-invasive devices

Last, the whole system is more oriented towards treatment rather than prevention. This is unfortunate, because the cost of treatment is usu-

ally more than the cost of prevention.

Hopefully, we will see more entrepreneurs taking the road to innovate for the medical sector. **EFY**
