

FEEDBACK

YOUR SUGGESTIONS

THANKS!

I have been a fan of EFY for the last 35 years. The magazine has grown from strength to strength. I thank all teams for their efforts. Your company interfaces with subscribers, and acts with lightning speed.

I have been a visitor to EFY exhibitions in Mumbai and have one suggestion. Once someone visits and you have their details, you should pre-register that person and send him/her the badge.

I have never had any problems with EFY and my copies always arrive by Indian Post without fail. Once, EFY Annual Edition was given free to all pre-registered visitors in Mumbai and I received a copy by mail also. Your team replied the day after I alerted it, and thanked me. This puts a face behind the organisation.

Frederick Fernandes

Through email

EFY. Thanks a lot for such a strong pat on our backs! It has made the day for our entire team—edit as well as support.

Thanks for the tip about the badge! We have started that process where we send a self-printable badge to our registrants, which they can print at home/office and bring along to the venue. There, we make the lanyards available, in which they can put the pre-printed badges and walk straight in—no queues. We shall be doing that also at India Electronics Week 2017 and Open Source India 2017—both in Bengaluru.

UPS POWER SUPPLY

I request you to publish UPS power supply circuits with and without

From electronicsforu.com

Electronics Projects

In 'Infrared Sensor Based Power Saver' circuit published in March issue, can we use 9V supply for PIR sensor as given in the circuit, or do we have to use a 7805, 5V regulator for it?

Swathi

EFY. 7805 regulator is not required for the PIR sensor because its power supply range is 5V -20V.

In 'Door Opening Alarm Using Hall Sensor' circuit published in August 2015 issue, MH183 hall sensor is used. Where can I find it online?

Joe

EFY. Please check www.rhydolabz.com/magnetic-rpm-c-137_149/hall-effect-sensormh183-unipolar-p-391.html

Corrections

In 'Voice-Controlled Home Automation System' published in October issue, collector and emitter pins of transistor T1 got interchanged in the component layout of the PCB.

Samiuddin

In 'Face Recognition Using Raspberry Pi' DIY article published in October issue, circuit diagram on page 104, the servo signal line is connected to GPIO16, whereas in config.py code in line 8, lock_servo_pin = 18 (servo signal line) points to GPIO18, which is wrong. It should be GPIO16.

Arnav Bansal

In 'Controlling A Robotic Car Through MATLAB GUI' circuit published in October issue, enable pins (EN1 and EN2) should be connected to 5V instead of 9V.

Manish S.T.

EFY. Thanks for pointing out the mistakes!

a microprocessor for powering Raspberry Pi. Its microSD card gets

damage easily in case of sudden power failure.

B. Chatterjee

Kolkata

EFY. You may refer to 'Mini UPS System' DIY circuit at <http://electronicsforu.com/electronics-projects/mini-UPS-system>

MORE ARTICLES

I have been reading EFY magazine for the last three years. EFY plus edition being an upgraded version should contain more advanced topics, tutorials, circuit designs and calculations. Kindly add tutorials or projects related to the following topics in upcoming issues, including RTOS, VLSI, high-power converters, control-loop designs for converters, motors (analogue/digital) and protocol implementations in embedded systems.

Ratish Ganve

Power electronics design engineer
Tata Power SED

EFY. Thanks for the feedback and suggestions! We will try to cover these topics in the forthcoming issues.

SOLAR CHARGER

Solar energy systems is a hot topic these days, so I request you to publish such topics. Please publish a simple solar charger circuit.

Labh Singh

Through email

EFY. You may refer to 'Hybrid Solar Charger' DIY circuit at <http://electronicsforu.com/electronics-projects/hybrid-solar-charger>
