

blood sugar levels and the damage these could cause can be reduced.

Handy fit in pocket. Though size never beats functionality, difficulty in removing a lancet or test strip and then inserting these into the device on a cold wintry night could be a nightmare. You can get a cut if the lancets are not big enough to handle during the dark of night while shivering in the cold. The strip, lancet and device are expected to be of handy form factor.

Plug-and-play monitoring and management. This functionality is expected by those who want to view graphs, charts and reports on a regular basis. Software that gives meaningful insights can help you gauge and analyse better. The ultimate goal is to achieve connectivity using cable slots or wireless connectivity with an insulin pump, if required. It is now possible to plug the device directly into a computer, and almost all devices that provide accurate data could be linked to the software module. Reports could be downloaded and compared every month or year, backed up and shared with anyone.

Autocoding beats miscoding and coding. Miscoding. You only spend a couple of minutes daily on these devices, and the last thing expected is a wrong reading. Meters can give false results and a miscoding can lead to 40 per cent chances of falsification, which, in medical terms, is a huge error for margin for a monitoring device.

Coding. Older devices need to be calibrated (coded) for accuracy. Coding provides a reference point for an instrument to start with reading and helps reduce error margin. If coding or calibration is not effective, the device can not be relied upon. Coding is often done by inserting a chip in the meter.

Autocoding. Nowadays, each strip is coded to the meter, so coding happens automatically.

Battery life. These devices could house anything from lithium-ion

button cells to rechargeable ones. The whole system works at about three volts in most cases, while monitoring devices with universal USB chargeable points are gaining popularity. Battery may last a couple of thousands of readings for some products.

Display size. Large OLEDs are a fad now. These may cost a little more as compared to their smaller LCD counterparts. But these might come in handy for aged users who can read large numbers more comfortably.

Must add to your cart

Fastest test timing with Omron.

Its predecessors used up nine times more time to detect. Now, claimed to give results in five seconds, this device can store up to 512 measurements. It has software support for reviewing historic trends for a multitude of time periods.

Expect more intelligence in Contour. It employs electrode biosensor method for glucose analysis; also has auto-log technology for comparing sugar spikes during meals. Loaded with a reminder and an OLED display, it is powered by a rechargeable battery and connects to any USB port to power up.

Always-active monitors from Accu-Chek. Handy and quite popular, these devices are powered by lithium-ion batteries, and the compact plus version lasts about 1000 tests. This device has features like automatic coding for every drum (containing test strips) change.

It is just a matter of time before more sophistication seeps into such biomonitors. Wireless technology and connected medical devices are all pointing to the fact that these devices are perfecting themselves to provide more accurate values and deliver more insights. In the days to come, regular glucose monitoring could be the key decision maker for healthy living, level of activity, nutrition and medication schedules to avoid complications of diabetes. **EFY**

SHAVISON™

Peripherals for Industrial Automation

- Black SMPS
- Digital Timers
- Analog Timers
- Hooters with Flasher
- Battery Charger

- SMPS
- Relay Interface Modules
- SSR Interface Modules
- FRC/ D-SUB connector
- Modbus I/O Modules
- Opto Interface Modules
- Power Distribution Modules
- Redundancy Modules
- Diode/ Resistor Modules
- Dedicated Controllers
- Analog Signal Converters
