

After this, draw wiring diagrams that show and name the termination points of each conductor. Some systems that are smaller in size can opt for a cable harness.

Last, prepare a wire list in spreadsheet or list format. This is mostly for the people performing the final assembly, so they know exactly which part goes where.

How Automation helps with design

Most of the features of Automation are extremely helpful for first timers. It lets you create databases for your components. As an added benefit, many component manufacturers have created their own free electrical CAD component databases for the software. Not only are these databases full of names, descriptions and the like, these

also contain electrical and mechanical symbols for individual components, thereby making it easier to generate lists.

Automation lets you implement module-and-model based drag and draw. So you can now create sub-assemblies that can be dragged into place among the bigger-level assemblies. Just this can create long documents of thousands of pages of design data created easily. More importantly, you can see the design from a larger perspective to see how everything fits into the bigger picture.

The huge team behind the software works on updates that are released every year, so you can work and comply with the latest industry standards. **EFY**
