

in plain English.

Friday integrates itself with the Android operating system on a very deep and intricate level to derive the content created by the user. The company has also deployed its proprietary algorithms to understand and store the content in such a way that it becomes easier for the application to fetch the information from the semantically mapped database as and when required.

Track your lost BlackBerry

The cost to replace a lost mobile device is usually the least of a wireless customer's worries. The bigger nightmare is the thought that your personal contacts, photos and other private information could fall into the wrong hands. But you can now track down your lost BlackBerry or Android phone, thanks to Sprint's total equipment protection application that provides coverage against loss, theft and damage.

The application helps you locate your lost device by sounding an alarm on the smartphone even if it is in silent mode, doing a real-time locate via GPS technology or viewing the smartphone's location history on a map via a Web interface. You can also remotely lock your lost smartphone and erase contacts in the address book (which can later be restored once you get your handset back).

Software for picture-perfect makeup

Now all girls can seek perfection during makeup, thanks to a new software developed at the Max Planck Institute, Germany.

The software takes a 3D image of your face and measures your complexion, shadows and lines. It then matches your face to 60 preprogrammed models and suggests how much makeup should be applied to which parts of your face. It also takes into consideration some personal facial characteristics like freckles or moles. Furthermore, it can determine whether your existing makeup suits your face. The calculation methods used for the makeup software can also be used to predict facial age progression.

"With these spatial models we can precisely analyse and evaluate the colour of skin, eyes and hair as well as the shape
