COMPONENTS

Current sensor module

Amp Tronics has launched current sensor module that gives current measurement (isolated) for both alternating-current and direct-current signals. Available in

ranges of 5A, 20A and 30A, the module does not require any current-sensing transformer.

The module offers 1.2 milliohm internal conductor resistance, 5V single supply operation and 66 to 185mV/A output sensitivity. The device bandwidth is set via filter pin and it features a low-noise analogue signal path.

Power ICs

National Semiconductor has introduced two new high-voltage system power management and protection integrated circuits (ICs) with on-chip power management bus (PMBus) support.

The 48V input voltage LM5066 and 48V input voltage LM5064 integrate high-performance system protection and management blocks that measure, control and manage the electrical operating conditions in systems such as routers, switches and base stations.

Both ICs have selectable 25mV/50mV current limit thresholds. The LM5066 features a voltage input range of 10V to 80V and the LM5064 operates over a range of -9V to -80V.

High-current relay

Tyc Electronics has introduced high-current relay HCR 200 for fuel-saving automotive start/stop functions. During the cranking phase of restart,

the relay disconnects the starter system from the vehicle's primary power system which is temporarily

supported by a second battery.

The HCR 200 relay is designed as a monostable, normally-closed relay, providing electrical continuity in case of a failure in the control circuit. The current carrying capability is up to 130A continuous at 110°C ambient. Continuous current up to 175A can be carried at +85°C ambient. Compared to conventional electronic solutions, the relay offers the additional advantage of galvanic isolation.

System-on-chip for STBs

Renesas Electronics has come up with system-on-chip (SoC) for set-top boxes (STBs). The EMMA3SE/P integrates in a single chip the functions necessary to receive digital broadcasts, including the ability to decode (decompress) digital video and audio signals and picture adjustment capabilities.

The SoC supports digital broadcast

and H.264 HD decoding. It employs a 40nm process and a 16-bit DDR3 memory interface to reduce the pin count. In addition to compatibility with MPEG2, MPEG4 AVC, DivXTM, VC-1, WMV, and the Chinese standard AVS, the EMMA3SE/P adds support for H.264 MVC for 3D TV broadcasts and formats such as VP6 and Sorenson Spark for IP broadcasts and content streamed over the Internet.

Instrumentation amplifier

Analog Devices has introduced an ultra-low noise, low-power low-distortion instrumentation amplifier

for measurement of extremely small signals present in noisy industrial operating environments.

The AD8429 has a current feedback architecture that offers 15 MHz ($G=1$) bandwidth and a 22V per microsecond slew rate. It has a low distortion of -130 dB. With 1nV/ $\sqrt{\text{Hz}}$ input noise and 45nV/ $\sqrt{\text{Hz}}$ output noise, the AD8429
