

“We think that LED market in India has potential, especially in the areas of general lights, street lights and other high-power industrial segments”

Jeremy Ng, managing director-R&D, Panasonic Semiconductor Development Asia, tells EFY bureau, the potential of LED drivers market in India

JEREMY NG
MANAGING DIRECTOR-R&D
PANASONIC SEMICONDUCTOR DEVELOPMENT ASIA

How do you see India as a market for LED drivers? What is the potential?

We see a very vibrant market for LED drivers with tremendous potential to grow in various sectors such as general lighting, automotive lighting and industrial lighting.

Do you see India just as a consumer market for LED drivers or would you also like to reach out to design engineers' community in India, which in turn can influence the sales in manufacturing hubs such as China and Taiwan?

We definitely want to reach out to the engineers in India who have the capability to build their own LED drivers. This is one of the reasons why we have been advertising about our LED driver and conducting seminars in India.

With the fast adoption of LEDs in India, we believe that manufacturers need to design their own solutions to differentiate from competitors and also to customise to India's requirement. Panasonic is committed to serve the Indian consumer market with its LED driver solutions. We are most willing to work with the local design engineers' community to raise India's capabilities to influence the

sales beyond India.

What are the latest technological changes that have happened in LED drivers?

LED drivers are becoming more general-purpose and flexible to cater to several applications. Higher integration, high efficiency, high current accuracy, power factor correction and lesser external components including elimination of E-Caps are some of the latest features in LED drivers.

How is Panasonic placed in the Indian market?

We are determined to increase our existence by maximising the customer's value through our close support and relationship with them. Panasonic has been increasing its presence for the consumer products in Indian market in the recent years. However, as regards Panasonic Semiconductor, we are still rather new in the market. Not everyone knows that Panasonic manufactures semiconductors and therefore we are still building our awareness level in the Indian market.
