

BINAY- Lighting Up The Future

Binay LED Aviation Obstruction Lights

BINAY LED-based MEDIUM INTENSITY Aviation Obstruction Light Beacon

(As per the International Civil Aviation Organization (ICAO) requirements for use on structures above 45m)

Available in Low Intensity and Medium Intensity versions (As per the International Civil Aviation Organization guidelines), BINAY's patented LED Aviation Lights come with a 5-year warranty

LED Obstruction Lighting for:

- Industrial chimneys and smokestacks
- Transmission, telecommunication, and weather towers
- Radio, TV and similar structural towers
- High-rise buildings and structures
- Airports and airfields

The BINAY LED Aviation Obstruction Light offers the following advantages:

- Fit-and-forget maintenance-free operation
- A long life of 100,000 hours (24 years at 12 hours-daily burning)
- Runs for itself within a short period of operation in the form of reduced installation, maintenance and servicing costs
- Quick installation; Minimum operation 265 days per year
- Shock-proof and vibration-resistant
- Over-Designed Intensity to allow for natural LED Intensity degradation over its operating lifetime

**THE BINAY LED OBSTRUCTION LIGHT IS UNDER ACCEPTED
PATENT, AND AS SUCH IS A PROPRIETARY PRODUCT**

become a reality, without the condition for human-like facial features, thanks to scientists from the University of Bologna in Italy, who have formulated a software that allows cars to 'communicate' with one another on the road.

While telematics, which unites telecommunications and informatics in cars, has been in use for some time, the Italian researchers have added one more ingredient. It unites telematics with the belief of the 'Internet of things' in which everyday objects have a presence online so they can be interacted with.

The ultimate intention is to link up all the cars on the road via WiFi, either by setting up a WiFi-enabled sensor in a car, or by downloading the software on to a smartphone. "By letting cars 'talk' to each other, we can see what happens kilometres ahead, whereas, current technology, instead, allows cars to perceive an obstacle only when it is physically in front of them," said Gustavo Marfia, team member.

The 'talking' is caused through acceleration sensors inherent in the cars that transmit an alarm message in unnatural conditions such as when a vehicle is involved in a collision. When the colliding car goes through a sudden acceleration change, this change would be captured by the sensor, and alert cars and drivers drawing close to the same spot. This alarm could disperse down the chain of vehicles in a relay so they could safely stop a long way before they reach the accident spot.

Now, emotionally intelligent robots for nursing

A team of scientists led by Queen Mary University in the UK is creating a new generation of emotionally intelligent robots that could become extra carers in hospitals and homes.

"Our research aims to develop software, based on biology that will allow robots to interact with humans in the most natural way, understanding things like personal space. These will be able to recognise human expressions and make expressive movements in response. This technology could further improve standards of hospital care, which are facing the growing pressure of increasing demand," said Prof. Peter McOwan, who is heading the European Union-funded four-year project involving specialists from seven countries.

The robots are also being built with a set of instructions about body posture and personal space that can be tailored to individual people. Scientists hope that the machines could also be used to create interactive children's toys and office helpers.

Material that controls the way light bounces off it

Serdar Kocaman, an electrical engineering PhD candidate and Chee Wei Wong, associate professor of mechanical engineering, in collaboration with scientists at the University College of London, Brookhaven National Laboratory, and the Institute of Microelectronics of Singapore have developed an optical nanostructure material that controls the way
