

WINDOW ALARMS

Protect Most Vulnerable Entry Points!

Windows are the most vulnerable entry points in a building. Window alarm is an effective security measure to deter most intruders

■ T.K. HAREENDRAN

All windows that are accessible from floor level, or windows that could possibly be reached by an intruder on a higher level need to be protected with reliable electronic security units. There are a number of protection devices used these days. The

two window alarms widely used today are magnetic sensor alarm that protects against anyone opening the window, and glass break sensor alarm that detects the sound of breaking glass.

Magnetic sensors

Magnetic sensors are also known as window and door sensors. The two

different types of magnetic sensors available are surface mounted sensor and a recessed model magnetic sensor.

A surface mounted magnetic sensor is housed in two small rectangular plastic casings – one holds a magnetically activated switch (reed switch) and the other one holds a magnet (bar magnet). The magnet section of the sensor is mounted on the wooden, metal or plastic edge of the window. The switch part is attached directly adjacent to the magnet on the window frame. This magnetic sensor is triggered when someone tries to open the window. The magnet part of the sensor moves away from the switch along with the window causing the magnetic field to break. Once the magnetic field is broken the reed switch creates an
