

graphics for clients. It is engaged in a range of software projects in server management, ultra-mobile, graphics, IT applications and factory automation. It also has a dedicated innovation team named Ideas to Reality Group (I2R), started in 2007, focusing on developing Intel architecture based solutions for the emerging markets.

Intel recently announced the availability of Intel Xeon processor E7 family (formerly codenamed Eagleton)—Intel's first ten-core processor with 30 MB of L3 cache memory and 2.9 billion transistors. Intel India team based in Bengaluru jointly led the design of the Intel Xeon processor E7 family, in collaboration with other teams in the US, Malaysia, Mexico and Costa Rica.

Intel India is working on the design and validation of next-generation server chips, and development of next-generation integrated graphics for clients. It's also working on the development of system-on-chip platforms for mobile phones. In addition, it is involved in throughput computing research and frugal innovation.

"The work we do here is significant and sizeable; one is looking at solving critical problems which can change Intel products and the other is end-to-end or complete ownership of the platform. India will also have a role to play when it comes to our future success in tablets and phones. Apart from that, we have parallel computing research work being done out of here. A core team of people is doing local market innovation like the Atom-based universal handheld device which has a biometric,

printer, GPRS and an integrated smartcard reader," informs Jitendra Chaddah, director, Intel India Strategic Development & Operations.

6 Nokia

Nokia has three R&D centres in India, one each in Bengaluru, Mumbai and Hyderabad. The centres are focused on next-generation packet-switched mobile technologies and communication solutions to enhance corporate productivity. While all the three centres are an integral part of Nokia's global R&D infrastructure and therefore work on global projects, these centres do play a pivotal role in assimilating local flavours from the market and act as a conduit for information to the global product development teams. Currently, Nokia has 1000 people working on various R&D projects.

Of the three centres, the Bengaluru R&D centre is the largest Nokia site in India. It was established in 2001 with the acquisition of Amber Networks. Over the years, it has played a pivotal role in the development of new applications, software platforms and chipsets for high-end Nokia mobile devices. The software platform group works on development of parts of the base services for the platform, application frameworks, user interfaces and test tools. On the chipset side, the work done in India is mainly in the areas of ASIC design, hardware design, integration and verification, protocol software design and integration, speech and video codec design and integration.

The facility today houses over 1200 employees across all teams.

PROTOTYPE & SMALL SERIES PCB SPECIALISTS
www.pcbpower.com

PCB DESIGN, FABRICATION AND ASSEMBLY

Single Side, Double Side and Multilayer PCB upto 16 layers
Extremely User friendly website
Instant Online Pricing and Ordering
Online Order Tracking

Express Delivery Available

Minimum Order Quantity - 1

Metal Backed (TMS) PCBs for High-Intensity LED Applications

Schematic Capture & Gerber Layout
Conversion of Through-hole to Surface Mount (SMT)

PCB Pooling Services
PCB On-Demand Services

PCB Assembly - SMT & Through-hole Technology
