

using this software, visit the LAlarm homepage at www.lalarm.com website or contact LAlarm Systems Support by sending an e-mail to support.en@lalarm.com.

LAlarm is a comprehensive laptop security application that contains a series of tools to help laptop users. It consists of seven alarms and several other security features designed to secure a laptop. The anti-theft alert can be enabled through the laptop's power adaptor or a USB flash drive connected to its USB port. The alarm triggers in the alarm when its power adaptor is disconnected from the power outlet or the USB flash drive is removed from the laptop.

LAlarm software also deletes sensitive data on the laptop through various settings to ensure that the data remains confidential if the laptop is stolen. There is a setting option to recover the data before permanently destroying it. Further, the software helps to prevent data loss or data corruption due to a sudden turn-off of the computer and/or physical and logical hard disk errors at an early stage.

LAlarm operation

Download LAlarm software from the Internet and install it on your laptop. After installation, LAlarm is automatically enabled and some alarm features are activated by default when the system is rebooted. The software works in the background of Windows applications.

LAlarm consists of five main alarms—thief alarm, perimeter alarm, inattention alarm, disk alarm and battery longevity alarm (refer Fig. 3). The theft and battery longevity alarms are already enabled. However, the alarms can be individually enabled or disabled from the 'Options' setting. The details of various alarms and their settings are given in 'Help' menu of the software. Note that some of the alarm features do not work in XP and lower versions of Windows OS.

Theft alarm and theft response feature are detailed below.

LAlarm features

Prevents laptop theft. Produces loud audio alert in case of laptop theft. Can also sound an alarm if the laptop is left unattended for a long time.

Protects sensitive data. Permanently destroys data if the laptop is stolen.

Keeps it within a perimeter. Sounds an alarm when the laptop leaves a certain area. Helps prevent laptop misuse and provides more security.

Prolongs battery life. Preserves battery capacity. Alerts when the battery is low or under stress.

Prevents data corruption. Alerts when sudden power loss is imminent. Allows to save files quickly and shutdown before power loss corrupts data.

Prevents data loss. Alerts of physical and logical hard disk errors. Alerts at an early stage to allow repairs before data loss.

Prevents laptop failure. Detects deterioration of the hard disk drive.

Theft alarm. For theft alarm, connect the laptop to a power outlet (refer Fig. 4) or lock it down to a table using a USB flash drive and its strap (refer Fig. 5). Activate the alarm by pressing Windows logo and L keys (Win+L) simultaneously. The activation is indicated by a beep sound.

Before pressing Win+L keys, wait until the LAlarm icon appears in the taskbar on the bottom-right side of the laptop screen. If there is no beep sound after pressing the keys, the theft alarm is not ready.

When the power adaptor or USB flash is removed, the theft alarm triggers to close the Windows application. The alarm continues to sound until it is disabled by entering the correct Windows login password. After four invalid login attempts, the user-account lockout is triggered. So take caution and remember your Windows login password before attempting this feature. For other alarms, there will be a
