

```
TabPage3 - Name= tabPageLogo, Text:
OEM Logo
```

6. Place the required controls in the corresponding tabpages and set their properties as shown in Figs 3, 4 and 5.

Software coding

Before you start coding, import the namespace IO which is used by .NET for input/output operations. Open the code view page and use 'Imports System.IO' on the top of the page. Now declare a global variable to store the logo path. Add 'Dim logoPath As String' just below where the class starts.

Now add the VB code (given at the end of this article) to the class.

To run the application, hit F5 on your keyboard or select 'Start Debugging' option from 'Debug' menu. If Visual Basic.NET is not installed in your system, you cannot do the design and coding. To run the application directly, a setup program has been

Fig. 7: System properties after creating the logo

included in this month's EFM-CD. Just click the setup program and the executable program is automatically installed in your system.

Let's take an example of creating EFM logo and support information using this program. When you run the executable program, you will see Fig. 3

displayed on the screen. Type 'EFY123' as the manufacturer and '2011' as the model, and click 'Create OEM Info' button under 'General Information' dialogue box. Type 'Testing OEM Logo' and click 'Create OEM Info' button under 'Support Information' dialogue box. Now 'OEM Logo' dialogue box appears. If you have already created the logo, browse the logo file and select it to put the logo on this page. Otherwise, click 'Design Logo' button to start designing 'EFY' logo using MS Paint. Save the logo bitmap file as 'oemlogo.bmp' and copy it to 'System32' folder. Now close this application, right-click 'My Computer' icon and select 'Properties.'

Refer Figs 6 and 7 for system properties before and after creating the OEM logo, respectively.

EFY note. The source code of this article has been included in this month's EFM-CD and is also available on the www.efymag.com website.

VB CODE

```
Private Sub btnAddSupportInfo_Click(ByVal sender As System.Object, ByVal e As System.EventArgs) Handles btnAddSupportInfo.Click
    Dim supportInfo As String = InputBox("Enter Support Information", "OEM Logo")
    If supportInfo <> "" Then lbSupportInfo.Items.Add(supportInfo)
End Sub
