

Robotics for You

Robotics—a technology that combines knowledge of electronics, mechanical and software engineering—is the most exciting field today. There are some really cool projects and applications using robots. Here are some websites for all robot enthusiasts

Go Robotics

Started in 1998, it is one of the most interesting websites on robotics. It has some really cool videos, circuit ideas on how to build a robot from scratch and robotic gift ideas. Mostly liked by hobbyists who play around with Open Source hardware and do-it-yourself projects, it is linked on social networks and has developed an online community to regularly contribute, work together and have fun with robotics.

Seattle Robotics

The 'encoder' page of this website lists the sites with 'home-built' robot information on how the projects can be started and finished (at least to the point of having a machine that actually moves or does something). The list includes the name of the robotic project, a brief description and link to its homepage. It is a modest collection of cool places where you can see what people are doing and, in many cases, how they did it. The 'projects' links you directly to the actual robot information.

Robotics India

It is an online forum that connects the robotics enthusiasts in India. You can post an announcement, news or start a discussion on any topic. The online community helps you to develop your robotics project much faster by providing you information on what's new, world's news, blogs, event details, etc. You can register yourself online. Once registered, you are connected to all the other members. There is a members' list which gives you details of posts and blogs submitted by the members.

NASA's Robotics Page

The robotics alliance project of National Aeronautics and Space Administration (NASA) aims at creating a human, technical and programmatic resource of robotics capabilities to enable implementation of future robotic space exploration missions. Although the objective of this page is to support American development, and inspire high school students to pursue robotics, it a good source of information on the latest developments, news and events related to robotics.

Society of Robots

It is a very resourceful collection of information on robotics books, projects, tutorials and journals. It has different categories to give you in-depth information on the skills and hardware like microcontrollers, sensors, actuators, batteries, electronics and mechanics. The website was first stated by Carnegie Mellon University alumni as a small hobbyist website complete with dozens of useful tutorials and a robot help forum. But now it has become much bigger, with hundreds of thousands of readers.
