

Intel iCore processor

tigate new materials and transistor structures, as well as innovative interconnect and packaging solutions for next-generation technology nodes. The research developments from this joint activity will enable delivery of silicon solutions that are optimised for performance, power consumption and size.

IBM and Samsung plan to develop advanced technologies for foundry customers, enabling energy-efficient

chips at 20nm and beyond.

New iCore processors

Intel has announced the second generation of its iCore processors which are also codenamed as Sandy Bridge. Earlier, if your computer did not have a dedicated graphics processor (graphics card), you could not play heavy-duty games. But this is now possible with the new processors designed to handle high-definition graphics and multimedia games.

And if you wish to beam your HD content right onto your TV wirelessly, you could do that too. The Intel Wireless Display (WiDi) feature of the processors adds full HD 1080p and content protection.

With the quick sync video technology, video can be converted from one format into another in less than 20 seconds. Normally, it would take approximately 4 minutes or even more.

Wireless devices to connect patients and doctors

Cisco Systems, in collaboration with Apollo Hospitals, is focusing on a telemedicine project that will help doctors connect with their patients through a laptop or any other mobile device from anywhere in the world. The project is a step ahead of the present concept of telemedicine which requires a room with the necessary infrastructure. There is a demand of quality bandwidth to make this project successful.

"If we succeed, it could be an ideal model to take telemedicine across India, especially to rural areas where doctors cannot reach," says Kaveh Safavi, vice president and global lead-healthcare practice Internet business solutions group, Cisco. "This is an experiment to create a completely different kind of telemedicine model," he added.
