

Retrofit PowerLED Tube Light

The BINAY PowerLED Retrofit tubelight fits directly into a standard fluorescent tube luminaire or strip

- Wattage less than 50% of fluorescent system, with similar light output
- Operates from 100VAC to 260VAC (No flickering at lower voltages)
- Provides sharper visual clarity than fluorescent tube
- Life of 12 to 15 years, with a warranty of 5 years

INVENTING NEW TECHNIQUES OF PRODUCING LIGHT

in full-body scanners. As this technology can create an almost naked image of the subject, it is certainly a privacy risk. Research organisations such as CMU are attempting to do only selective perception – that is, blur private parts while only revealing metallic objects such as weapons.

Hyper-spectral imaging, compact yet powerful lenses, scene and event modelling, representation and reconstruction, human activity analysis, social signal processing, facial expression and gesture recognition, face and body tracking, distributed video surveillance, behavioural biometrics, new feature selection and extraction methods, vision for multimodal fusion, mathematical description and integration of contextual information, spatio-temporal dynamics of actions, recognition of signs and emblematic gestures, visual action grammars, benchmarking studies on novel databases, vision for elderly care, smart cars and smart buildings are all key areas of research related to vision systems for ambient intelligence.

Web 3.0. Twitter, location-based services on mobiles, maps and navigators – Web 2.0 is surely ubiquitous in the real sense and hence an indelible aspect of the ambient electronics scene. But Web 3.0 is going to be even more advanced. Location and context awareness, immediacy, and anywhere-everywhere feel that mobile technologies and social networks have brought about will be enriched by information organisation, intelligence and self-learning capabilities of the Semantic Web, making it one of the most important elements of ambient intelligence.

In India too, there is significant research happening in almost all aspects of ambient intelligence, in the IITs, Indian Institute of Science, private colleges as well as research wings of companies. They might not have a separate lab dedicated to ambient intelligence *per se*, but through their existing research wings they are contributing significantly in the areas of speech synthesis, machine learning, intelligent vision systems, miniaturisation of chips and so on. IIT-Kharagpur's department of computer science and engineering is also doing good work in this space, and has recently even taken up ambient intelligence as a key thrust area.

Need of the hour

All this is just a glimpse of the work happening in this space. Almost each of the ambient intelligence modalities is advancing at a rapid pace. As Mahesh opined, the need of the hour is 'solutioneering' and not mere engineering. Should that happen, we will swiftly be catapulted into the era of truly ambient intelligence – and inevitably so! ●

PowerLED Indoor Lights

- Extremely Low power consumption
- Long life (in excess of 50,000 hours)
- Models with light output to match conventional indoor lights
- No maintenance required : very low Lifetime Ownership Cost

BINAY - Lighting Up The Future
