

A stator blade in the turbine stage of a jet engine is heated by the combustion gases. To prevent the stator from melting air is passed through a cooling duct in the blade.

Capture the Concept.

With COMSOL Multiphysics® you are empowered to build the simulations that accurately replicate the important characteristics of your designs. The key is the ability to include all physical effects that exist in the real world. This multiphysics approach delivers results—tangible results that save precious development time and spark innovation.
