

# DESIGNING IN INDIA: PART 1

## Boom Time for India Design Centres

Multitudes of great products and features, if not 'made in India,' are at least 'designed in India.' India design centres (IDCs) and independent design houses (IDHs) are creating value through excellent designs and intellectual property. Despite many challenges they face, they are all set to capitalise on the opportunities ahead, and hint at a fantastic growth rate. In the first of a two-part series covering the design scenario in India, let us look at how the IDCs are doing

A product cannot merely be 'made' to win, it has to be first 'designed' to win. Design is not only a key element of a product's success but also very valuable intellectual property (IP). You might already be aware that Indian minds are behind some of the best designs in the world — be it an interesting feature of your new

mobile phone or a brilliant element in your operating system!

Really, gone are the days when electronics products were all defined and designed in USA and Europe. Today, designs are made across the world — by the best minds as well as by the people best equipped to understand and cater to a local market's needs and desires.

India is considered a high-growth, high-opportunity market. Hence there

9. Texas Instruments (India)
10. Xilinx Development Corporation

is a need to design-in the needs of the Indian consumer into any product. Plus, India is also a knowledge hub, and Indian engineers are truly capable of producing great designs. In short, India's design houses are capable of delivering the best designs, not only for India but also for a global user base.

Not surprisingly, Indian wings of global companies (India design centres or IDCs), which design and develop purely on behalf of their parent company, as well as independent design houses (IDHs) that create product and component designs and IPs for multiple clients, are doing some excellent work in this field, despite the challenges they face on the operations and market fronts.

We at EFY set out to explore the design scene in India — the opportunities, threats and challenges facing Indian
