

in North American and other markets will remain constrained by the success of media tablets like Apple iPad.

Semiconductor market to grow slower

The semiconductor industry is positioned for continued, albeit slower, growth in 2011, according to Gartner. Worldwide semiconductor revenue is forecast to total \$314 billion in 2011 – up 4.6 per cent from 2010's estimated revenue of \$300.3 billion.

Worldwide semiconductor revenue is estimated to have grown 31.5 per cent in 2010, with the industry surpassing the \$300-billion mark.

Memory is the only segment forecast to decline in 2011, with revenue forecast to decrease 2.4 per cent. DRAM is expected to decline 15.6 per cent due to weaker-than-expected PC demand and declining DRAM prices. NAND memory, however, is expected to grow 24 per cent, as it is the main storage medium designed into many hot consumer electronic products.

From an application perspective, smartphones, mobile PCs and media tablets will fuel semiconductor growth through 2014. Media tablets are seeing rapid growth due to the success of the Apple iPad, and the market will continue to see strong growth with greater competition in this space. Gartner estimates that semiconductor revenue from media tablets will grow from \$2.4 billion in 2010 to \$17.8 billion in 2014.

Mobile marketing and advertising revenue to approach \$1.5 billion

The audience for mobile marketing and advertising is growing steadily, and spending on the new medium is growing in parallel. One six-month period in 2010 saw spending expand in the US by almost 2.5 per cent, and a new ABI Research study indicates that in 2016, revenue from mobile display ads will be close to \$1.5 billion.

Although the market for mobile advertising and marketing is starting from a very small base, it is showing steady, solid growth. The survey

revealed that about one-third of the smartphone owners polled had clicked at least one mobile advertisement.

Before 2010, this industry was seen as quite experimental, but there was a shift starting at the end of last year from the pioneering phase to what we might call the early growth phase. By now, probably 20 per cent of all major companies have done something with mobile marketing, and some of them are doing so repeatedly. Today's mobile campaigns can cost \$100,000 or more and annual budgets may run to several million dollars.

Mobile devices will bring 3D to mainstream

ABI Research anticipates that mobile devices may turn out to be the best form factor to bring 3D technology into mainstream markets. By 2015, 3D devices including smartphones, notebooks, mobile Internet devices and portable game players will comprise over eleven per cent of the total mobile devices market.

Emerging 3D technologies for mobile devices do not require the user to wear glasses to view the 3D content, says senior analyst Victoria Fodale. While there are still challenges before glasses-free 3D on televisions, it is possible on smartphones and other mobile devices. Glasses-free technologies require an optimal viewing distance and a screen size that is better suited for single-viewer applications like those used on mobile devices.

And, according to Fodale, unlike 3D TVs, the mobile category has a fast replacement cycle. This means consumers are more likely to buy a mobile device with 3D in an upgrade purchase much sooner than they would purchase 3D in a larger form factor such as a flat-screened television.

Mobile 3D devices will be driven by creation of user-generated 3D content through integrated video and still cameras, playback of 3D content and 3D gaming. Some 3D devices will also support conversion of 2D content into 3D.
