

Microcontroller-Based Projects

This book is a collection of 25 construction projects which appeared in *Electronics For You* during 2001-09. The accompanying CD contains datasheets of major components used in the projects, source codes and related files. It includes useful books, tutorials and other goodies too.

The book covers projects based on some commonly available microcontrollers from Atmel, Microchip and Freescale. In addition to block diagrams and hardware details of the projects, software programs of some projects are illustrated along with flow-charts. While giving full details of single-sided printed circuit boards for the projects, double-sided boards have been avoided as they are not within the reach of most readers.

The book can be used by engineering students, teachers, practicing engineers and hobbyists alike.

Electrical for Competitions

If you are looking for a career in the field of electrical engineering, this book is your detailed and handy reference for theory. It contains thousands of objective questions and answers with detailed solutions. This helps you correct the fundamentals and apply to the problems that you may face in competitive examinations for recruitment.

The book covers electromagnetics theory, electrical materials, electrical circuits, measurements and instrumentation, control systems, electrical machines and power transformers, power systems, analogue and digital electronic circuits, microprocessors, communication systems, power electronics, signal and systems. Syllabi of all the main competitive examinations are completely covered.

Elements of Robotic Systems

This book on the fundamentals of robotics is quite useful for students interested in practical robotic topics, professional working on robotic systems and researchers looking for solutions in various aspects of robotics.

There are a total of 18 chapters covering various aspects of robotic systems in use, under development and possible future development. Topics covered include basic terminologies, degrees of freedom, manipulator fundamentals and their design, system errors, multiple-arm robots, mine-detection robots, vehicle behaviour in uneven terrains, design of walking and crawling robots, electrically driven autonomous robots, tele-operations for remote functioning, sensors for various sub-systems of robots, military robots, industrial robots, computer vision, image processing, etc.
