Sales of smartphones are skyrocketing. Going forward, even stronger demand for these handsets is expected. The demand for low-cost smartphones has been on the rise and this trend is expected to continue.

Manufacturers are planning to take smartphones to the masses to drive revenues. For instance, many companies have announced plans to bring down the price of smartphones to Rs 10,000.

There are different configurations available in the market. Which one you buy depends on your requirements. However, you should buy the latest version with newest technology if you can afford.

To help you choose the right smartphone, here are some basics followed by things to look for.

How smart is a smartphone?

Basically, smartphones are cellphones with many added functions unlike traditional cellphones originally designed

just for phone calls and messages. Using the advanced digital and Internet technology, smartphones function as a personal digital device or a mini personal computer that you can carry wherever you go.

With a smartphone in hand, besides the fundamental features like phone calls and messaging, you can send and receive e-mails, organise your personal and office documents, and access the Internet to track stock trends, search information, play online games, read news, etc. Moreover, all smartphones can be synced with PCs or laptops to
