

share and load files or software from each other.

The most common features of today's smartphones include a touch screen, a range of software applications, Internet access capability, e-mail messaging, ability to sync with computers and an operating system.

All smartphones use an operating system which supports the operation of software applications. For example, BlackBerry runs on the BlackBerry OS and iPhone from Apple on the iPhone OS. In addition to basic applications of software including calendar, address book and contact organiser set in most common mobile phones, smartphones have much more to do with software. Most common software applications in the majority of smartphones include document and photo viewing and editing, GPS mapping and application download. Another important feature of most smartphones is Internet access at remarkable speeds, which is supported by the advancement of 3G technology and Wi-Fi network.

Things to look for

Network and connectivity. There are multiple connectivity options like EDGE, GPRS, Wi-Fi, 3G and Bluetooth A2DP. "While 3G has become almost an indispensable feature for any smartphone claiming a good market

iPhone 3GS

Features

- Weight: 135 gm
- Size: 115.5×62.1×12.3 mm³
- OS: iOS 4
- Display: 8.9cm (diagonal) widescreen multi-touch with 480×320-pixel resolution at 163 ppi, fingerprint-resistant oleophobic coating and support for display of multiple languages and characters simultaneously
- Network and wireless: UMTS/HSDPA (850, 1900, 2100 MHz), GSM/EDGE (850, 900, 1800, 1900 MHz), 802.11b/g Wi-Fi and Bluetooth 2.1 + EDR wireless technology
- Camera: 3-megapixel with tap to focus, and photo and video geotagging
- Capacity: 8GB flash drive
- Other features: Assisted GPS, digital compass, accelerometer, proximity sensor, ambient light sensor

The processor should be in line with the hardware and applications of the phone and should be powerful enough to allow the phone run smoothly

share, other connectivity features like WiMAX and LTE are already in the horizon of the Indian market. In fact, a couple of smartphones with WiMAX compatibility are already available globally, though the service itself is yet to start in India. These along with

3G promise to take connectivity to the next level and would definitely prove to be a value for money to users," says Ajay Sharma, country head, HTC India.

Not all smartphones support all types of network technologies. So it is best to select a phone that supports majority of network technologies. This is because the connectivity features largely depend on the network technology you use. For instance, you will get a GPRS connection on a 3G and GSM network, but not on a CDMA network. Majority of smartphones feature Bluetooth connection.

E-mail connectivity. The phone should support push mail feature and multiple e-mail accounts.

Hardware. Hardware in the smartphone includes the camera features, keyboard and CPU, ROM and RAM. "All the smartphones vary in terms of RAM, and if you wish to store loads of

Motorola QUENCH XT5

Features
