

JAVASCRIPT-BASED ATM SIMULATOR INTERFACE

■ BUKYA SRIDHAR

Automated teller machine (ATM), also called automated cash vending machine, is found almost everywhere in cities and towns. ATM provides customers easier access to their bank accounts by using a magnetic-stripe plastic smart card or credit card issued by the bank in which the person holds the account. Just walk over to the nearest ATM, insert your card into the machine, press the buttons as per instructions on the screen, and walk away with your money and a receipt. Using a credit card, you can access your bank account at an ATM even in another country.

Here we present a JavaScript-based

ATM simulator with interactive keypad, monitor, sample in-built ATM card and the denominations of the amount dispensed. JavaScript can be run on any operating system that has Internet Explorer version 6.0 or above (exclusively for Windows-based systems).

Software program

The ATM_SIM.HTM program, tested on Windows 7 Home Basic OS with Internet Explorer 8.0, is a simple program. When run, it displays a graphical user interface (GUI) (refer Screenshot 1). The GUI has closed circuit camera button on top of the screen, keypad in the middle, bank statement, ATM card and cash slots on the right and virtual ATM card at the bottom of the screen. The remaining part of the GUI is the chassis of the machine.

The encrypted-like text below the virtual ATM card is nothing but 'ATM_Locker_cum_Circuitry' written

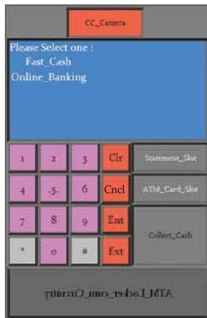

in reverse. This text has been flipped horizontally by using style tag's filter element to make it look like a real ATM machine, and has no operational significance. Similarly, the 'CC_Camera' button in the program has no application in this program.

The program initially displays a welcome message. Below the message screen is a violet and red-coloured keypad. The keys in violet colour are numeric for entering the personal identification number (PIN). Here the default PIN is '1234'. The red keys 'Clr', 'Cncl', 'Ent' and 'Ext' are control keys. 'Clr' is to clear the PIN, 'Cncl' to cancel transaction, 'Ent' to execute and 'Ext' to exit the program. On the right side of the screen are three slots
