

Fundamentals of Industrial Instrumentation

This textbook on industrial instrumentation provides a fundamental background in theory and measurement system performance, and establishes the physical principles and practical techniques employed to measure those quantities.

Designed for a one-semester course on industrial instrumentation or instrumentation devices, the book is structured with short chapters, each dealing with specific topic—either measuring variables or the device itself.

Problems are given at the end of some chapters with the answers at the end of the book. Problems on Vortex shedding and Coriolis flowmeter have also been included with a brief introduction to these flowmeters.

Principles of Electromagnetism

Written in a lucid language, the book provides a simple and logical representation of the basic concepts and principles of electromagnetic fields. The one-semester textbook for undergraduate students of electronics and telecommunications engineering begins with fundamentals of electric and magnetic fields, and has wide coverage of topics on energy, potential and capacitance concepts.

The book also covers topics including magnetostatic, magnetic materials and the behaviour of magnetic field at the boundary of different media. There are solved examples for understanding the topics. Also, the book contains problems and multiple-choice questions with each chapter to develop problem-solving skills.

Simple Projects: You Can Make at Home

The book is a collection of hardware-based projects that appeared in Electronics For You magazine from the year 1979 to 2004. The 60 fully-tested circuits in the book, with complete functional descriptions, construction details, parts lists and PCB layouts, can be of use to engineering students, teachers, practicing engineers and hobbyists alike.

The book is divided into five sections in accordance with the application of the circuits: Alarm, Controller and Indicator, Display and Lighting, Timer and Clock, and Game. The Alarm section contains seven projects; Controller and Indicator section contains twenty-four projects; Display and Lighting section contains eight projects; Timer and Clock section contains twelve projects; and the Game section—specially included to encourage students and beginners to learn electronics—contains nine projects.
