The lifespan of a consumer notebook depends on various mutually exclusive factors including usage pattern and climate conditions (humidity and dust) where the notebook is being used. It also depends on the needs of the consumer himself.

Usually, notebooks have a working life of three to five years. Parameters that play an important role in determining the lifespan are advanced power management and its usage pattern.

However, due to the rapid advancements in technology, most notebooks become obsolete within two-three years. After three years, most notebooks tend

to accumulate problems beyond the capability of economical repair.

It's not about the battery only

Battery is definitely a key component which determines the lifespan of a notebook, as it is a consumable.

However, the battery is only one component in the entire notebook and there are various other factors too (like maintenance of the LCD screen, vents and keyboard) that are equally important. Notebooks are subject to more abuse—being portable—than desktops, which is why notebooks have shorter lifespans. If an average notebook made today were placed in a clean, well-
