

The Leading 50 Privately-run Management Colleges Of India

The initiative aims to showcase the institutes that churn out managers with a bent towards technology.

The *Electronics For You* team is pleased to publish, for the second consecutive year, the results of the survey conducted by it to identify and recognise those privately-run institutions that are not only attracting a large number of students to their business management programmes but also focusing on the creation of tech-savvy managers.

We published the first such survey report in March 2010 edition of *'Electronics For You.'*

Why the survey?

For over four decades now, EFY has been focusing on its mission to accelerate the 'development' and 'deployment' of technology in India. In line with the same objective, EFY identified an area where it could contribute and play a role in highlighting the level of professional education in India. Like our last year's survey report, this year too the goals of conducting this survey have remained the same. The survey aims to recognise those business schools that are striving for excellence and working towards creating tech-savvy management professionals. Besides, it attempts to make India's future generation of engineering professionals aware of the good business schools that they can opt for, to pursue management courses.

For whom is this study relevant?

We believe that this report featuring India's leading 50 privately-run MBA institutes will be able to address the two key problem areas that seek a quick solution. First, with MBA institutions coming up all over India, aspiring students get confused while choosing the 'right' institution. This challenge gets more complex when one has to choose from hundreds of 'private' business colleges. Second, recruiters at technology firms

are also on the lookout for institutions that produce talent that meets their requirements. While the leading institutions like the IIMs are known to all, things get confusing when the recruiters have to access talent from private colleges. This survey will help in addressing both these challenges.

What's new?

Unlike last year, when we roped in a market research agency to conduct the survey and share the findings with us, this year the entire survey has been done by the editorial team of *Electronics For You* magazine. The methodology adopted was as follows: Letters to over 1000 privately-run MBA colleges were sent to invite participation in the survey. More than 400 institutes expressed interest for participation in the survey to whom a digital survey form was sent out, seeking the required information and documents to validate the claims and figures shared. To ensure that there is no trace of any bias in the published list, this survey was kept open to all privately-run business colleges without any participation fee.

The methodology

Once the details were received, the evaluation process began. This involved a lot of data crunching. First, we plotted the data based on various parameters, such as applications received for the flagship programme, statistics related to the percentage of students placed on the campus and average per annum salary offered to students in the given year and so on.

Based on the two-fold goal of the initiative, weightage was assigned to each of the parameters and the final list of 50 leading colleges was derived using a percentile method used in statistical computing. Apart from arriving at this

list, we have also included lists of top 10 colleges for each of the key parameters, like technology infrastructure, faculty, industry placements, etc. Absolutely objective practices were followed to arrive at this list of the leading colleges.

Whether or not to go by the survey?

Since the survey is based on a few parameters that were relevant for this study, the list of the leading 50 participating institutions only reflects their respective standing based on this pre-decided criteria, which aimed at showcasing those management colleges that are focusing on creating tech-savvy managers. Besides, not all privately-run colleges participated in the study; mostly because they could not send the required data, supported by the relevant documents, within the stipulated time frame. Indeed, the nomination form was quite elaborate and sought exhaustive details. But we couldn't have compromised on this aspect as the study demanded a comprehensive questionnaire.

So, the survey can be taken as an indicative list that attempts to give an idea of the leaders amongst those institutions that participated in the survey, and not as an absolute criterion to judge the standing of an institution.

In a nutshell

We are hopeful that our initiative will succeed in helping our readers (which also include heads of technology companies) recruit better tech-savvy managers and also motivate MBA institutes at large to augment focus on enhancing their technology infrastructure. The study is also likely to give a fair idea to the MBA aspirants, especially from the technology background, to make an informed choice of institute for pursuing their MBA degree. ■
